Ink Parsing in Sketch-Based Interfaces
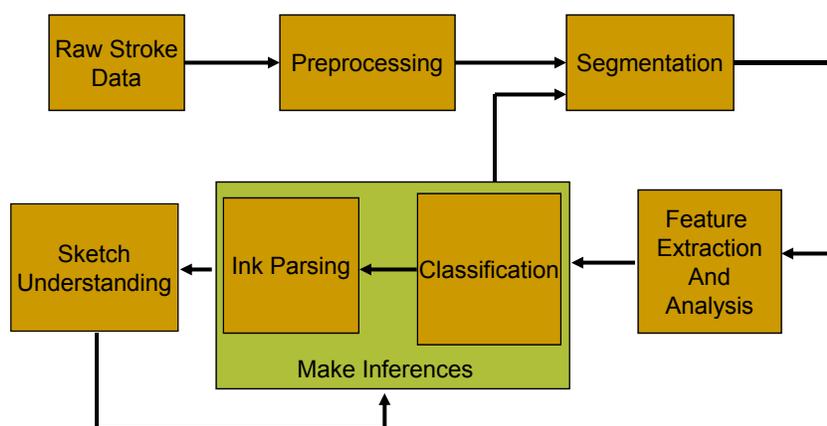

Lecture #11: Ink Parsing

Joseph J. LaViola Jr.

Fall 2009

Recall Pen-Based Interface Dataflow

Sketch Parsing

- Often recognition of strokes is insufficient
  - except for gestures
- Require an understanding of spatial relationships
  - good examples are mathematical expressions
- Higher level classifications
  - is it a word or a drawing?
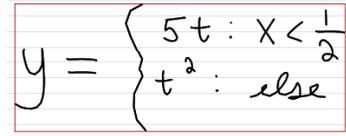

$$y = \begin{cases} 5t : X < \frac{1}{2} \\ t^2 : \; else \end{cases}$$

Approaches to Sketch Parsing

- Top down vs. bottom up
- Focus on mathematical expressions
  - 2D (coordinate) grammars
  - graph rewriting
    - useful for other types of parsing as well (diagrams, tables, lists, etc…)
  - projection profile cutting
  - procedurally coded syntax rules
  - stochastic grammars
- Other parsing approaches
  - conditional random fields
  - statistical visual languages
  - many others

2D Grammars

- Grammar + spatial relationship rules
  - useful if a well defined syntax exists
  - looks for key symbols
- One Approach – Box Grammar
  - divide input into distinct areas based on symbol found
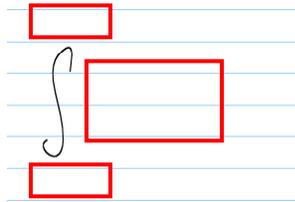

Graph Rewriting

- Expressions represented as nodes and arcs
- Rewrite rules applied to graph to reduce it progressively
  - rules are also subgraphs
  - graph reduced to single node representing expression

Graph Rewriting Example (Blostein and Grbavec 1996)

- Build
  - add edges between symbols (above, below, left, superscript, subscript)
- Constrain
  - Apply knowledge of notational conventions
    - remove contradictory associations
    - disambiguate horizontal lines
    - disambiguate dots
    - disambiguate diagonal associations
- Rank
  - Use information about operator precedence to group symbols into subexpressions
- Incorporate
  - Interpret subexpressions

Projection Profile Cutting

- Used primarily in document analysis
- Uses horizontal and vertical projections of expression onto x and y axis
  - subdivides expression recursively
- Problem with expressions where symbols are close together (no white space)

Procedurally Coded Syntax Rules

- Observations about domain coded programmatically
  - similar to rule based approach for recognition
- Sample rule for horizontal line

A length threshold of 20 pixels is used to classify a horizontal line as a short or long bar.

If it is a long bar and has symbols above and below, it is treated as a division.

If there are no symbols above, it is treated as a boolean negation.

If a short bar has no symbols above or below, it is treated as minus sign.

If it has symbols above or below, the combination symbols such as =, ≤, and ≥ are formed.

Stochastic Grammars

- Used to deal with noisy data and spatial ambiguities
- Probabilities associated with each production rule
- For any sequence in a given parse – probability can be calculated
- Requires training

MathPad² Parsing Approach

- **Uses 2D coordinate grammar approach with some syntax rules**
- **Basic approach**
  - preprocessing step (for functions)
  - sort list of symbols
  - parse functions – use grammar
  - process functions – handle spatial relationship testing
    - intermixed with parse functions

Grammar (1)

```
<math_formula>      ::= <equation> | <expression>
<equation>          ::= <expression> <relational_op> <expression> |
                        <expression> ''='' <cond_expression>
<relational_op>     ::= ''='' | ''~='' | ''<'' | ''>'' | ''<='' | ''>=''
<cond_expression>   ::= ''{'' <cond_statement>
<cond_statement>    ::= ''if'' <expression> '':'' <logic_expression>
                        {''elseif'' <expression> '':'' <logic_expression> }
                        <expression> '': else''
<logic_expression> ::= <equation> <logical_op> <logic_expression> | <equation>
<logic_op>          ::= ''and'' | ''or''
<expression>        ::= <term> ''+'' <expression> |
                        <term> ''-'' <expression> |
                        <term> ''^'' <expression> |
                        <term>
<term>              ::= <factor> ''*'' <term>   |
                        ''('' <expression> '')'' |
                        <factor>
<factor>            ::= <sub_expression> ''/'' <factor> |
                        <sub_expression>
<sub_expression>   ::= <integral> | <derivative> | <summation> |
                        <function> | <terminal>
```

Grammar (2)

```
<integral>        ::= ''int('' <expression> '',''  <variable> '')'' |
                      ''int('' <expression> '','' <variable> '',''
                              <expression> '','' <expression> '')''
<derivative>      ::= ''diff('' <expression> '','' <variable> '')'' |
                      ''diff('' <expression> '','' <variable> '',''
                              <integer> '')''
<summation>       ::= ''sum('' <expression> '')'' |
                      ''sum('' <expression> '','' <expression> '',''
                              <expression> '')''
<function>        ::= <func_name> ''('' <expression> '')''
<func_name>       ::= ''sqrt'' | ''abs'' | ''log'' | ''exp'' |
                      ''sin'' | ''cos'' | ''tan'' | ''asin'' |
                      ''acos'' | ''atan''
<terminal>        ::= <variable> | <number>
<variable>        ::= <letter> |
                      <letter> ''_'' {<integer>} {<letter>} {<integer>}
<number>          ::= <integer> |
                      <integer> ''.'' <unsigned_int>
<integer>         ::= <sign> <unsigned_int> | <unsigned_int>
<unsigned_int>    ::= <digit> <unsigned_int> | <digit>
<sign>            ::= ''+'' | ''-''
<digit>           ::= [0-9]
<letter>          ::= [a-z] | [A-Z] | [alpha-zeta]
```

Parse functions

- High level parse
- Expression parse
- Sub-expression parse
- Symbol specific parsing
  - square root parse
  - integration parse
  - summation parse
  - fraction parse
- Factor parse
- Term parse

$$\frac{2\int x^2 dx}{(x-4y)^8}$$

$$\frac{6x+y}{3+\sin(x)}$$

7

Process functions

- **Provide parse functions important info**
- **Deal with spatial relationships**
  - implicit operators
  - fractions and square roots
  - summations , derivatives, integrals
  - Conditionals

$$X(t+h) = \begin{cases} \ell - r : x(t) > (\ell - r) \\ r : x(t) < r \\ x(t) + vh : else \end{cases}$$

Reducing parsing decisions

- **Use application to reduce decisions**
- **Implicit operators (no numbers have subscripts)**
- **Correct trig functions 5in -> sin**
- **Functions of time f(+) -> f(t)**
