# Pen-Based Gestural User Interfaces

Lecture #6: Gestures Joseph J. LaViola Jr. Fall 2013

Fall 201:

CAP 6105 - Pen-Based User Interfaces

©Joseph J. LaViola Jr.

#### What is a Pen Gesture?

- Simple ink stroke or strokes to convey an idea
  - fast to perform
  - easy to remember
- Typically disappear after they are recognized
- Supports in-band interaction

Fall 2013

CAP 6105 - Pen-Based User Interfaces

Joseph J. LaViola Jr.

# Gesture Types

- Single stroke
- Multi-stroke
  - compound gestures
  - punctuated gestures
- Trade-off in recognition between single and multiple stroke gestures
- Used in
  - modeling
  - command languages
  - invoking interface widgets

Single stroke gesture

Multi-stroke gesture

### Gestures in Modeling

- Used in 2D/3D object modeling
- Distinction between sketch-based modeling and gestures in modeling
- Used to
  - create geometry
  - manipulate geometry
  - guidance for computational algorithms

www-ui.is.s.u-tokyo.ac.jp/~takeo/research/teddy/teddy.htm

Fall 2013

### **SKETCH**

- Seminal work by Zeleznik et al. (1996)
- Conceptual modeling
- Uses simple lines and curves to build geometric primitives
  - □ cubes, cylinders. pyramids, etc...
- No machine learning-based recognition used
  - simple FSA
- Does make use of modifier keys

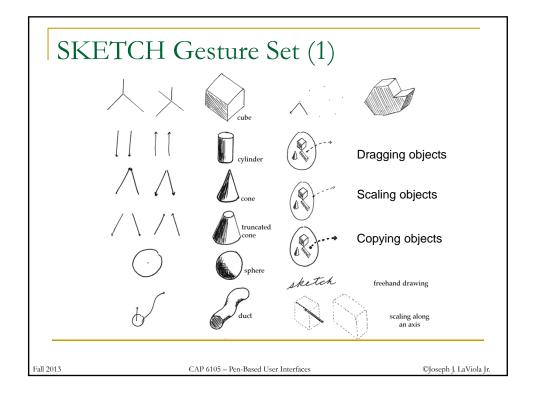

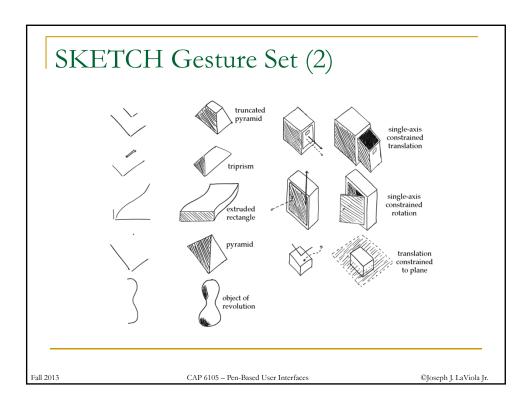

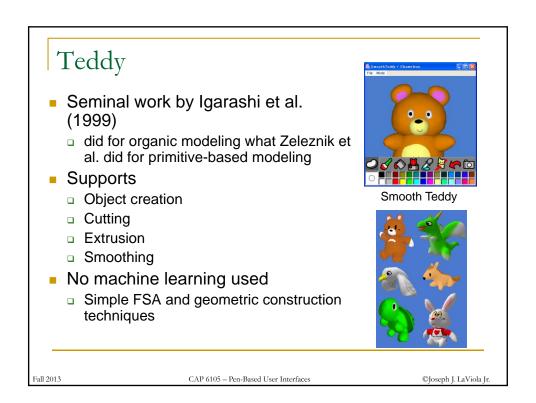

Fall 201:

CAP 6105 - Pen-Based User Interfaces

©Joseph J. LaViola Jr.

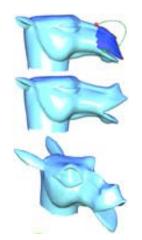

# Surface/Mesh Editing

- Fine line between sketching and gestures
- Uses simple gesture as input to a surface editing algorithm
- This type of approach has been used for image processing as well
  - see work of Salesin

Nealen et al. (2005)

Fall 201:

## Gestures as Command Languages

- Gestural commands
  - replace traditional WIMP user interfaces
  - also used to invoke interface widgets
- Notion of in-band gestures
  - invoking commands and operations at the location of interaction
  - contrasts with having to move to top/side of the screen to press a button or find a menu item
- Used in
  - entering text
  - text editing
  - note taking
  - mathematical apps
  - etc...

Fall 2013

CAP 6105 - Pen-Based User Interfaces

#### Graffiti

- Language for entering text
- Maps to keyboard
- Used with Palm Pilot
- Single stroke language
  - Has prefix for some symbols
- Takes a while to learn

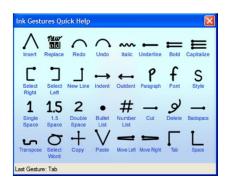

Fall 201

CAP 6105 - Pen-Based User Interfaces

©Joseph J. LaViola Jr.

### Text Editing

- Example of a gesture set taken from real world and developed for pen computers
- Natural connection between pencil and paper and computer

www.jumpingminds.com

#### MathPad<sup>2</sup>

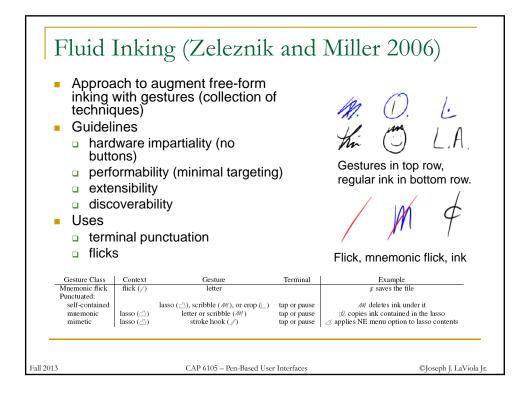

- Simple gesture set for
  - invoking operations
  - manipulating ink
- Uses notion of punctuated gestures
  - multi-stroke (gesture + punctuation)
  - makes use of context
- Why?
  - reduce number of gestures
  - overload appropriate gestures
  - reduce conflicts

all 2013 CAP 6105 – Pen-Based User Interfaces © Joseph J. LaViola Jr.

# Recognizing Gestures

- FSA's and simple primitive operators
  - conditionals and saving state from one event trigger to another
  - Operators can be features
    - same features used in machine learning!
    - features must be excellent discriminators
- Machine learning techniques
  - SVMs, K-nearest neighbor, AdaBoost
  - more on this soon!

### Anatomy of a Gesture

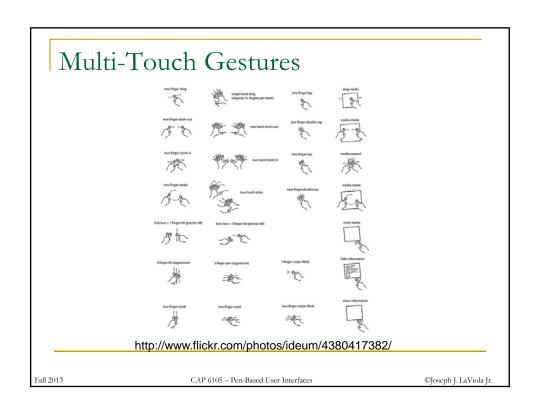

Fall 2013

```
Input: Strokes s_{i-1} and s_{i-2}, a bounding box threshold \epsilon_{box}, and a line
                                                  difference threshold \epsilon_{diff}.
 Detecting and equal
                                                  Output: True or false.
 sign
                                                  \text{DetectEqualSign}(s_{i-1}, s_{i-2}, \epsilon_{box}, \epsilon_{diff})
                                                           P \leftarrow Points(s_{i-1})
                                                            Q \leftarrow Points(s_{i-2})
                                                          b_1 \leftarrow BoundingBox(s_{i-1})
                                                          o_1 \leftarrow BoundingBox(s_{i-2})
slen_1 \leftarrow \sum_{i=2}^{n} \|P_i - P_{i-1}\|
slen_2 \leftarrow \sum_{i=2}^{n} \|Q_i - Q_{i-1}\|
if \quad slen_1 > \epsilon_{box} \sqrt{Width(b_1)^2 + Height(b_1)^2} \quad \text{or } slen_2
\epsilon_{box} \sqrt{Width(b_2)^2 + Height(b_2)^2}
                                                                return false
                                                  (9)
                                                            if Width(b_1) < Height(b_1) or Width(b_2) < Height(b_2)
                                                  (10)
                                                               return false
Note that as the gesture
                                                  (11)
                                                            \mathit{diff}_1 = |X(P_1) - X(Q_1)|
set increases the more
                                                  (12)
                                                            diff_2 = |X(P_n) - X(Q_n)|
                                                            \text{if} \quad LineOverlap(P_1,P_n,Q_1,Q_n) \text{ and } \textit{diff}_1 < \epsilon_{\textit{diff}} \text{ and } \textit{diff}_2 < \epsilon_{\textit{diff}}
tests you typically have
                                                  (13)
                                                  (14)
                                                              return true
to employ to avoid
                                                  (15)
                                                            _{
m else}
conflicts.
                                                  (16)
                                                                 {f return} false
```
