3D User Interface Hardware

Lecture #7: Input Devices
Spring 2010
Joseph J. LaViola Jr.

Interaction Workflow
Lecture Outline

- Input device characteristics
- Desktop devices
- Tracking devices
  - position
  - eye
  - gloves
- 3D mice
- Direct human input
- Building special input devices

Input Devices

- Hardware that allows the user to communicate with the system
- Input device vs. interaction technique
- Single device can implement many Its
Input Device Characteristics

- Degrees of Freedom (DOFs) & DOF composition (integral vs. separable)
- Type of electronics: Digital vs. analog
- Range of reported values: discrete/continuous/hybrid
- Data type of reported values: Boolean vs. integer vs. floating point

More Input Device Characteristics

- User action required: active/passive/hybrid
- Method of providing information: “push” vs. “pull”
- Intended use: locator, valuator, choice, ...
- Frame of reference: relative vs. absolute
- Properties sensed: position, motion, force, ...
Desktop Devices: Keyboards

- Chord keyboards
- Arm-mounted keyboards
- “Soft” keyboards (logical devices)

Desktop Devices: Mice and TrackBalls

- Many varieties
- 2D input to 3DUI
- Relative devices
Desktop Devices: Pen-based Tablets

- Absolute 2D device
- Either direct or indirect

Desktop Devices: Joysticks

- Isotonic vs. Isometric
Desktop Devices: 6-DOF Devices

- 6 DOFs without tracking
- Often isometric
- SpaceBall, SpaceMouse, SpaceOrb

Tracking Devices: Position Trackers

- Measure position and/or orientation of a sensor
- Degrees of freedom (DOFs)
- Most VEs track the head
  - motion parallax
  - natural viewing
- Types of trackers
  - magnetic
  - mechanical
  - acoustic
  - inertial
  - vision/camera
  - hybrids
Other Uses For Trackers

- Track hands, feet, etc.
  - “whole body” interaction
  - motion capture application
- Correspondence between physical/virtual objects
  - props
  - spatial input devices

Tracking Physical Objects (Props)
Magnetic Trackers

- Example: Ascension Bird
- Advantages
  - good range
  - no line of sight issues
  - moderately priced
- Disadvantages
  - metal or conductive material will distort the magnetic field
  - magnetic field can interfere with nearby monitors

Mechanical Trackers

- Example: Fakespace BOOM tracker
- Advantages
  - low latency
  - very accurate
- Disadvantages
  - big and bulky
  - usually only one sensor
  - reduced mobility
  - expensive
Acoustic Trackers

- Example: Logitech Fly Mouse
- Also known as ultrasonic tracking
- Advantages
  - no interference with metal
  - relatively inexpensive
- Disadvantages
  - line of sight issues
  - sensitive to certain noises

Inertial Tracking

- Example: InterSense IS300, Wiimote
- Advantages
  - no interference with metal
  - long range
  - no need for transmitter
- Disadvantages
  - subject to error accumulation
  - only track orientation
Optical/Vision-based trackers

- Exs: Vicon, HiBall, ARToolkit
- **Advantages**
  - accurate
  - can capture a large volume
  - allow for untethered tracking
- **Disadvantages**
  - image processing techniques
  - occlusion problem

Hybrid Tracking

- Example InterSense IS900
- **Advantages**
  - puts two or more technologies together to improve accuracy, reduce latency, etc...
- **Disadvantages**
  - adds complexity
Tracking Devices: Eye Tracking

- CyberGlove, 5DT
- Reports hand posture
- Gesture:
  - single posture
  - series of postures
  - posture(s) + location or motion

Tracking Devices: Bend-Sensing Gloves
Tracking Devices: Pinch Gloves

- Conductive cloth at fingertips
- Any gesture of 2 to 10 fingers, plus combinations of gestures
- > 115,000 gestures

3D Mice

- Ring Mouse
- Fly Mouse
- Wand
- Cubic Mouse
- Dragonfly
- ...

Spring 2010
Human Input: Speech

- Frees hands
- Allows multimodal input
- No special hardware
- Specialized software
- Issues: recognition, ambient noise, training, false positives, …

[Image: http://www.lindamoran.net/images/yelling.jpg]
Human Input: Bioelectric Control

Human Input: Body Sensing
More Human Input

- Breathing device - OSMOSE
- Brain-body actuated control
  - muscle movements
  - thoughts!

Why Build 3D UI Devices?

- Assist in designing new interaction techniques
- Improve upon existing techniques
- Provide interfaces for specific 3D interactions and applications
- Give users more expressive power
- Develop new interaction styles
- Develop new and improved 3D interface hardware
- Fun!!!!
Tools of the Trade

- Sensors, buttons, switches, controllers, etc...

3D Input Device Building Strategies

- Device function
  - What will the device sense?
    - force
    - motion
    - button presses
  - what physical device types are required?
    - need to choose appropriate sensors
      - digital/analog
      - pressure, bend, potentiometers, thermistors
      - conductive cloth (great sensing material)

- Sensor housing
  - How will sensors be placed in the physical device?
    - physical constraints
    - physical comfort
  - How to build the housing?
    - milling machine
    - vacuform device
    - 3D printer
    - Lego bricks
    - modeling clay
Device Ergonomics

- Good ergonomic design is crucial
  - device housing
  - control types
- Issues to consider
  - device should be lightweight
  - avoid fatigue
  - simple to use
  - easy to reach buttons and controls
  - avoid undue strain
  - don’t want to cause user pain

Connecting Devices to the Computer

- Need to connect device to the computer
  - USB
  - serial port
  - Bluetooth
- Often need a microcontroller (not always)
  - small computer that can interface with other electronic components
  - PIC (www.microchip.com)
  - BasicX-24 -- easy to use
    - programming in Basic
    - has nice development kit
- A typical approach
  - build electronics with prototyping board
  - write code in IDE and download to board
  - test and debug
  - put electronics on circuit board
  - write device driver

http://www.it.boton.ac.uk/staff/lp22/CS133/haptics.html

www.basicx.com
Software for the Device

- Need to have software to use device in applications
- Several strategies
  - write driver from scratch
    - need to know something about OS - low level support functions
    - understanding of serial/USB communication protocols
    - typical functions - open, close, read, write
    - plug into API
  - utilize existing software - provide drivers for many devices and machinery to create new ones
    - VRPN - developed at U. North Carolina
    - VRJuggler - developed at Iowa State
  - interface device toolkits
    - Phidgets
    - I-CubeX

Case Study 1 - Interaction Slippers

- Providing more powerful methods of expression
- Offload functionality to the user’s feet
- Input Device
  - pair of commercial house slippers
  - embedded Logitech Trackman Live™ - wireless trackball
  - conductive cloth
- Allows for toe and heel tapping
- Interact with the Step WIM
  - miniature version of the world placed on the floor
  - toe tap to invoke the WIM
Case Study 2 – Reinventing the Pinch™ Glove

- Pinch Gloves
  - determines of two or more fingertips are touching
  - uses conductive cloth
  - designed for pinching and grabbing gestures
  - at the time $2000
  - had problems with reliability
- Wanted to build custom device
  - less expensive ($200)
  - more flexibility
    - not just pinching gestures
    - plug-n-play
    - allow for a variety of switches

www.fakespacelabs.com

Flex and Pinch Input

- Dealing with input device limitations
  - bend sensing gloves vs. pinch gloves
  - improve existing interaction techniques
- Input Device
  - 16 conductive cloth contacts
  - used with bend sensing glove
  - Can be placed anywhere
- Improve image plane interaction techniques
  - allow user to activate selection with primary hand
  - multiple flex button configurations
CavePainting Table

- Improve a specific application
  - explore prop-based interaction
  - used for painting 3D scenes
- Input Device
  - tracked paint brush
  - paint cup props
    - uses conductive cloth
  - bucket Tool
  - misc. knobs and switches
- Hold down brush button to paint
- Dip paint brush into paint cups to change strokes
- Use bucket to throw paint

FingerSleeve

- Inspiration for creating novel interaction techniques
- Pop through buttons
  - use light and firm pressure
- Input Device
  - worn on index finger
  - made from elastic fabric and flexible plastic
  - 6 DOF tracker attached to the back of the sleeve
  - interesting design issues with button style and placement
- Principle
  - light pressure used for temporary action
  - actions confirmed by firm pressure
- ZoomBack Technique
  - temporary and permanent travel
- Snapshot Technique
Case Study 3 - 3motion

- 3D gesture interaction system
  - developed by Keir et al. 2005, Digital Design Studio, Glasgow School of Art
  - designed as inexpensive tracking solution
  - used for gesture tracking
- Components
  - single chip 3-axis linear accelerometer
  - several buttons
  - wireless bluetooth communication
  - software SDK
- Tested in gaming environment and character manipulator
- Used on cell phone to play virtual golf
- Can you say, “Wii”?
From Lab to Production (2)

Prototyping Toolkits – Phidgets

- Phidgets (Greenberg and Fitchett 2001) - building blocks for low cost sensing/control
  - uses USB
  - clean separation of hardware and software
  - simple API
  - Don't need to worry about microprocessors, communication protocols, soldering
  - Variety of sensors
    - touch
    - light
    - force
    - vibration
    - rotation
  - Other tools
    - accelerometers
    - switches
    - RFID tags
    - etc...

Analog Inputs  Digital Inputs

Digital Outputs

www.phidgets.com
Prototyping Toolkits – I-CubeX

- **I-Cube** (Mulder 1995) - uses the Musical Instrument Device Interface (MIDI)
  - MIDI - protocol for communicating control information
  - also uses Bluetooth (wireless)
  - similar advantages to Phidgets
    - no microcontroller programming
    - no circuit design
    - software API
- **Variety of Sensors**
  - air
  - touch
  - bend
  - temperature
  - magnetic
  - light
  - tilt

Next Class

- **Selection and Manipulation**
- **Readings**
  - 3DUI Book - Chapter 4
