## Kinect SDK – Joints

- Two users can be tracked at once
- $\langle x,y,z \rangle$  joints in meters
- Each joint has a state

## Kinect 2 JointServer – VS2013

- Gathers joint data from the Kinect 2
- Encodes data into a string and sends it over UDP socket
- Run from the VisualStudio or  
JointServer\bin\Debug\JointServer.exe
- Requires Kinect SDK 2.0
- This needs to be started before you press Play in Unity3D
- Can be left running, i.e. do not need to restart each time to press Play in Unity3D

Spring 2016

©Joseph J. LaViola Jr.

# JointUnity

- Main script – KinectSkeleton.cs
  - Receives data from UDP socket
  - Decodes it and updates joint values
  - This script has to be attached to some object in your scene to work
- Demo use script – SkeletonEmulator.cs
  - Example use of KinectSkeleton API

Spring 2016

©Joseph J. LaViola Jr.

## JointUnity API

  - False if the joint position is inferred
  - Inferred position can be very close to the truth or completely wrong.

# Notes

- Kinect 2 randomly assigns ID to players it sees.
- If you step out of the frame and back you will likely get a new ID.
- Due to this even with a single player in frame you will have to look through all 6 players in API to find one that isTracked.
- At times Kinect cannot see certain joints and it will guess their position.
- In KinectServer joints that are inferred will have thin lines drawn to the instead of thick color ones.
- Color of the skeleton displayed in KinectServer represents player ID.
