Computer Science Division
University of Central Florida

Managing And Maintaining Windows Server 2008

- With an operating system as large and complex, and functionally rich as Windows Server 2008, the OS is only as good as the tools available to expose this functionality, configure it, and manage it on a day to day basis.
- By now you are somewhat familiar with the process necessary to install Server 2008 since you should have done this in your virtual environment. Soon you will become familiar with installing and configuring server roles as well.
- This set of notes will examine in some detail the Server Manager and the functionality it provides a system administrator for managing and maintaining a Server 2008 environment.

Server Manager In Windows Server 2008

- The Server Manager is the biggest factor in effectively managing a Windows Server 2008 environment.
- The Server Manager brings together into one management tool the entire process of managing a server operating system.
- The Server Manager interface is designed around the functionality the server provides, instead of being designed around the individual components.

Server Manager In Windows Server 2008

- The guiding principle in the design of Server Manager was how system administrators think about their servers.
- If you ask a system administrator to show you their server room, they don't point to "my Windows Server 2008 box, my Windows Server 2003 box, and my Ubuntu box." Instead, they say "that's my domain controller, that's my file server, and that's my print server."
- System administrators think of servers by their role, or what they do, and not by the server operating system.
- Windows Server Manager is designed to work the same way.

Server Manager In Windows Server 2008

- Windows Server Manager works by having the server running both **roles**, which are the major services the server offers along with **features** that help the server perform its main role purpose.
- For example, Windows Backup is a feature, as it helps keep a server maintained by providing backup and recovery capabilities.
- During your previous installs of Windows Server 2008 you utilized the ICT (Initial Configuration Tasks) interface and this causes the Server Manager to automatically run and launch at each Administrator logon. To refresh your memory, a screen shot of the Server Manager screen you see at logon is shown on the next page.

The server manager in Windows Server 2012 looks a bit different but has essentially the same functionality as the server manager in Server 2008.

Server Manager In Windows Server 2008

- Let's take a closer look at some of the main features of the Server Manager.
- When the Server Manager is launched, initially it runs as a two-pane Microsoft Management Console (MMC) environment with the Console/Navigation tree pane (left pane) and the Details pane (right main pane) as shown on the previous page.
- The Console tree pane breaks the functionality of the Server Manager into five main areas:

The screenshot displays the Windows Server Manager interface. On the left is the 'Server Manager (MARK-SERVER-1)' tree view, which is the 'Console/Navigation pane'. It lists various server components such as Roles, Features, Diagnostics, Configuration, and Storage. The main area is the 'Roles' pane, which is the 'Details pane'. It shows a summary of installed roles (2 of 16), including Active Directory Domain Services and DNS Server, both with warning icons. Below this, it details the 'Active Directory Domain Services' role, including its description and status (8 running, 2 stopped). The interface includes a menu bar (File, Action, View, Help), a toolbar with navigation icons, and a taskbar at the bottom with the Start button and system tray.

Console/Navigation
pane

Details pane

Server Manager In Windows Server 2008

- **Roles.** Enables the administrator to install, remove, and manage roles for the server. Contained within roles is a child node for each role; this in turn has child links to the MMC snap-ins used to manage the role functionality.
- **Features.** Enables the admin to install, remove, and manage features for the server. As with roles, there is a child node for each installed feature, which in turn has child links to the MMC snap-ins used to manage the feature functionality.
- **Diagnostics.** Links to the snap-ins used to troubleshoot and diagnose problems, such as performance issues.
- **Configurations.** A consolidated interface to the snap-ins used for granular control of the server, which consists of the Tasks Configuration, Windows Firewall, Services, and Windows Management Instrumentation (WMI) Control.
- **Storage.** Links to the Disk Management and Windows Server Backup (WSB_ snap-ins.

Server Manager In Windows Server 2008

- Aside from all the functionality provided in the Console tree, the main page of the Server Manager, when the Console tree root is selected, is a powerful area for system administrators.
- The Server Summary section of the main page resembles the ICT (Initial Configuration Task) window because it is the same content.
- Once the server is initially configured, any subsequent configuration modification is done via the Server Manager and not ICT.
- The Server Summary is divided into two main areas: Computer Information and Security Information (see page 6).

Server Manager In Windows Server 2008

- The Computer Information area provides details on the fully qualified domain name of the computer if it is part of a domain, or just the NetBIOS name if it is only in a workgroup.
- The domain or workgroup that the server is joined to is displayed , along with the network adapters in the server and the IP address information for both IPv4 and IPv6.
- The ability to change any of this information is provided by the links to the right of the displayed information. These links are to control panel applets that enable the configuration of the displayed attributes.

Server Manager In Windows Server 2008

- The second area of the Server Summary is the Security Information, which gives critical information relating to the security of the server.
- For the Server Manager, this means whether the Firewall is turned on or off, how the server is being updated, when the updates were last checked for and when they were last installed.
- Finally, the status of Internet Explorer Enhanced Security Configuration is shown. This prompts you to indicate if you want to mark a web site as safe or ignore it for now.
- Notice on the next page, that the server shown has had recent updates to Windows Server 2008 recently installed.

The screenshot shows the Windows Server Manager interface for a server named TESTBEDSERVER. The 'Server Summary' section is expanded, showing the following details:

- Computer Information:**
 - Full Computer Name: TestBedServer
 - Workgroup: WORKGROUP
 - Local Area Connection: IPv4 address assigned by DHCP, IPv6 enabled
 - Remote Desktop: Disabled
 - Product ID: 55041-363-7898201-76928
 - Do not show me this console at logon
- Security Information:**
 - Windows Firewall: On
 - Windows Updates: Install updates automatically using Windows Update
 - Last checked for updates: 9/16/2013 2:33 PM
 - Last installed updates: 9/16/2013 2:39 PM** (highlighted with a red box)
 - IE Enhanced Security Configuration (ESC): On for Administrators, On for Users

On the right side of the console, there are several task buttons: 'Configure Remote Desktop', 'Go to Windows Firewall', 'Configure Updates', 'Check for New Roles', 'Run Security Configuration Wizard', and 'Configure IE ESC'. A blue arrow points from a text box to the 'Last installed updates' field.

Today is September 16, 2013 – Notice that Windows updates were last done this afternoon on this server.

Server Manager In Windows Server 2008

- The next section of the main section of Server Manager is the Features Summary which lists the features that are installed and has links to Add or Remove Features.
- No status is provided for any of the installed features because typically they help facilitate a role's duties and do not, or their own, provide a service. There are exceptions to this. Windows Internet Name Service (WINS), for example, provides a direct service. However, the experience for features is not as integrated as with roles, and no summary information is provided, you simply see which features are provided.

Server Manager - Managing Roles

- The main function of the Server Manager is to provide an interface that manages what the server does.
- What the server does is controlled by what roles the server has, e.g., “that’s my domain controller, that’s my DNS server, that’s my file server.”
- On the Server Manager main page, the Roles Summary displays the list of roles that are installed and their health state based on event logs and monitored services for the role.
- Before we look more closely at a role, let’s look at the main Roles page in the Server Manager.

Server Manager - Managing Roles

- Like the Server Manager main page, the Roles main page has the same Roles Summary section, plus the option to add and remove roles. (Click on the Roles link in the configuration tree in the right pane of the main Server Manager window to go to the main Roles page.)
- After the Summary section is a section for each installed role, which will include an icon to set the Role information being shown or hidden (arrow pointing up shows role information, arrow pointing down hides role information).
- As we will see later, the role for ADDS is handled somewhat differently from most other roles to primarily to its complexity.

Server Manager - Managing Roles

- The next page illustrates the information shown for the File Services role as it is installed on a server.
- The real power of the Server Manager begins to be understood when you select a specific role. By selecting a specific role you are given a great deal of information about the health of the role and guidance on how to manage it.
- On the Roles main page you'll see the actual event logs, which relate to all services that the role owns or utilizes that have been generated in the last 24 hours. Each event log can be double-clicked to see the full event information.

Server Manager - Managing Roles

- The Roles page for a specific installed role provides information on three critical areas surrounding a role:
 - Events: logged in the last 24 hours relating to this role.
 - System Services: provides a listing of the system services that provide functionality to this role. This does not mean all the services that were installed as part of the role; some might be used by multiple roles. It just means that the service is important to the functionality of the role, so its status is shown. For example the ADDS role lists 10 separate services.
 - Role Services: enables the addition and removal of role services for installed roles. The particular role services depend on the role. The picture on the next page illustrates the role services for the File Service role.
