## Introduction to PHP – Part 3

Instructor :      Dr. Mark Llewellyn  
                         markl@cs.ucf.edu  
                         HEC 236, 407-823-2790  
                         <http://www.cs.ucf.edu/courses/cnt4714/spr2010>

School of Electrical Engineering and Computer Science  
University of Central Florida

# PHP and Database Connectivity

- PHP offers built-in support for a wide variety of database systems from Unix DBM through relational systems such as MySQL to full size commercial systems like Oracle.
- We'll continue to use MySQL as the underlying database system so that you can easily compare the work we've done with MySQL using Java servlets and JSPs.
- Before you go any further in these notes you must configure PHP to access MySQL databases. Beginning with PHP 5, MySQL is not enabled by default in PHP, nor is the MySQL library bundled with PHP.
  - Versions of MySQL greater than 4.1.0 use MySQLi extensions.
  - Versions of MySQL less than 4.1.0 use MySQL extensions.

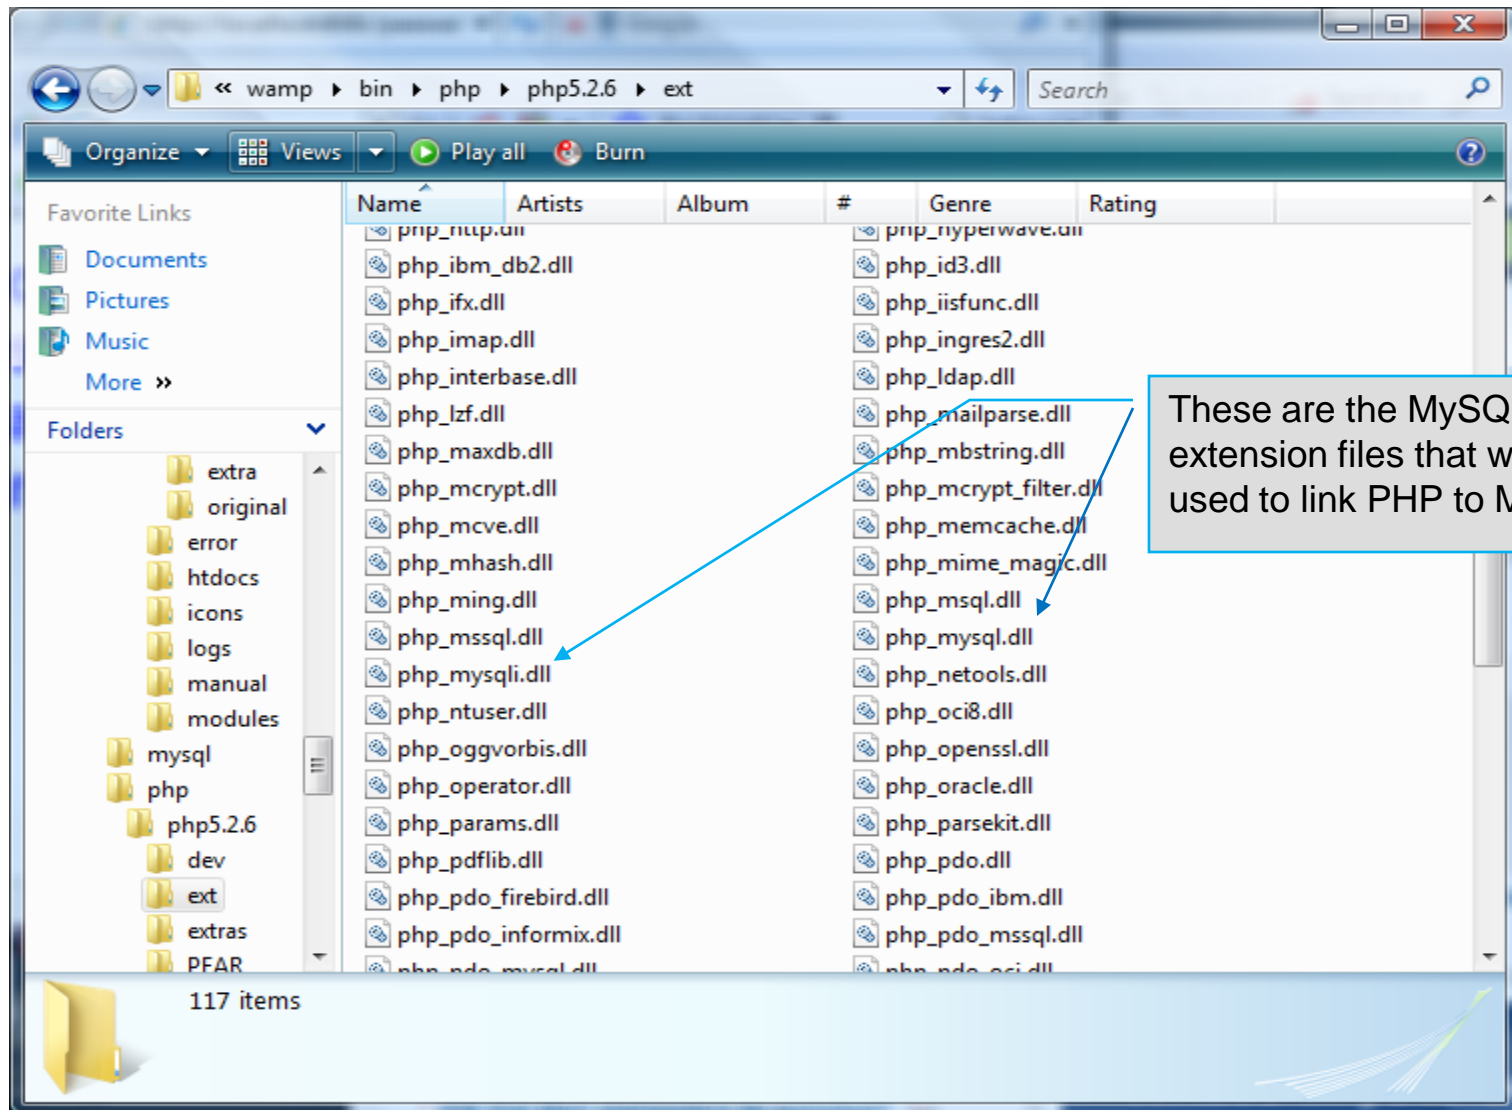

# PHP and Database Connectivity (cont.)

This is the MySQL library that both mysql and mysqli extensions require.

# PHP and Database Connectivity (cont.)

A Simple PHP Document

PHP should be configured for MySQL. You can verify that the php.ini file was properly read and the MySQL extensions are loaded by running the info.php script and looking for these entries.

**mysql**

MySQL Support	enabled
Active Persistent Links	0
Active Links	0
Client API version	5.0.51a

Directive	Local Value	Master Value
mysql.allow_persistent	On	On
mysql.connect_timeout	60	60
mysql.default_host	no value	no value
mysql.default_password	no value	no value
mysql.default_port	no value	no value
mysql.default_socket	no value	no value
mysql.default_user	no value	no value
mysql.max_links	Unlimited	Unlimited
mysql.max_persistent	Unlimited	Unlimited
mysql.trace_mode	Off	Off

**mysqli**

Mysqli Support	enabled
Client API library version	5.0.51a

# PHP and Database Connectivity (cont.)

- PHP contains a fairly extensive set of commands that can be used to access and manipulate MySQL databases.
- A very brief listing of some of these commands appears on the next page.
- For a complete listing see:

<http://us2.php.net/manual/en/print/ref.mysql.php>.

<http://us2.php.net/manual/en/print/ref.mysql.php>.

# Portion of `mysqli.dll` Extension

The screenshot shows a Microsoft Internet Explorer browser window with the title "PHP: Improved MySQL Extension - Manual - Microsoft Internet Explorer". The address bar displays the URL "http://www.php.net/manual/en/ref.mysqli.php". The main content area lists various `mysqli` functions and their descriptions:

- [mysqli\\_field\\_tell](#) -- Get current field offset of a result pointer
- [mysqli\\_free\\_result](#) -- Frees the memory associated with a result
- [mysqli\\_get\\_client\\_info](#) -- Returns the MySQL client version as a string
- [mysqli\\_get\\_client\\_version](#) -- Get MySQL client info
- [mysqli\\_get\\_host\\_info](#) -- Returns a string representing the type of connection used
- [mysqli\\_get\\_metadata](#) -- Alias for [mysqli\\_stmt\\_result\\_metadata\(\)](#)
- [mysqli\\_get\\_proto\\_info](#) -- Returns the version of the MySQL protocol used
- [mysqli\\_get\\_server\\_info](#) -- Returns the version of the MySQL server
- [mysqli\\_get\\_server\\_version](#) -- Returns the version of the MySQL server as an integer
- [mysqli\\_info](#) -- Retrieves information about the most recently executed query
- [mysqli\\_init](#) -- Initializes MySQLi and returns an object for use with `mysqli_real_connect`
- [mysqli\\_insert\\_id](#) -- Returns the auto generated id used in the last query
- [mysqli\\_kill](#) -- Asks the server to kill a MySQL thread
- [mysqli\\_master\\_query](#) -- Enforce execution of a query on the master in a master/slave setup
- [mysqli\\_more\\_results](#) -- Check if there any more query results from a multi query
- [mysqli\\_multi\\_query](#) -- Performs a query on the database
- [mysqli\\_next\\_result](#) -- Prepare next result from `multi_query`
- [mysqli\\_num\\_fields](#) -- Get the number of fields in a result
- [mysqli\\_num\\_rows](#) -- Gets the number of rows in a result
- [mysqli\\_options](#) -- Set options
- [mysqli\\_param\\_count](#) -- Alias for [mysqli\\_stmt\\_param\\_count\(\)](#)
- [mysqli\\_ping](#) -- Pings a server connection, or tries to reconnect if the connection has gone down

# PHP and Database Connectivity (cont.)

- Now that you have PHP set to accept MySQL extensions, let's connect to the bike database that we used for examples with Java servlets and JSPs.
- The following example is a simple database connection process in PHP where the client interacts with the database from an XHTML form that simply asks them to select which attributes from the bikes table that they would like to display. This is done through the `data.html` file.
- When the client clicks the submit query button, the `database.php` script executes by connecting to the database, posting the query, retrieving the results, and displaying them to the client.

Sample Database Query From PHP

## Querying a MySQL database from a PHP Script.

Select a field to display: \*

- \* (selected)
- bikename
- size
- color
- cost
- purchased
- mileage

**Send Query**

Done Internet | Protected Mode: Off 100%

Execution of data.html (client side of the application) showing the drop-down menu for the client to select the attributes for the query.

When the selection is made and the **Send Query** button is clicked the results on the following page will be displayed.

Results of query **SELECT \* FROM bikes**. Display indicates that 10 rows were included in the result.

# Cookies

- A **cookie** is a text file that a Web site stores on a client's computer to maintain information about the client during and between browsing sessions.
- A Web site can store a cookie on a client's computer to record user preferences and other information that the Web site can retrieve during the client's subsequent visits. For example, many Web sites use cookies to store client's zipcodes. The Web site can retrieve the zipcode from the cookie and provide weather reports and news updates tailored to the user's region.
- Web sites also use cookies to track information about client activity. Analysis of information collected via cookies can reveal the popularity of Web sites or products.

# Cookies (cont.)

- Marketers use cookies to determine the effectiveness of advertising campaigns.
- Web sites store cookies on users' hard drives, which raises issues regarding security and privacy. Web sites should not store critical information, such as credit-card numbers or passwords, in cookies, because cookies are just text files that anyone can read.
- Several cookie features address security and privacy concerns. A server can access only the cookies that it has placed on the client.
- A cookies has an expiration date, after which the Web browser deletes it.

# Cookies (cont.)

- Users who are concerned about the privacy and security implications of cookies can disable them in their Web browsers. However, the disabling of cookies can make it impossible for the user to interact with Web sites that rely on cookies to function properly.
- Information stored in the cookie is sent to the Web server from which it originated whenever the user requests a Web page from that particular server. The Web server can send the client XHTML output that reflects the preferences or information that is stored in the cookie.
- The location of the cookie file varies from browser to browser. Internet Explorer places cookies in the Cookies directory located at `C:\Documents and Settings\...\Cookies`

# Cookies (cont.)

- After a cookie is created, a text file is added to this directory. While the name of the file will vary from user to user a typical example is shown below.

- The contents of a cookie are shown on page 74.

# Cookies (cont.)

- Now let's create the code necessary to create our own cookie.
- In this example, a PHP script is invoked from a client-side HTML document. The HTML document creates a form for the user to enter the information that will be stored in the cookie. (Often the information that is stored in a cookie will be extracted from several different areas and may involved tracking the client's actions at the Web site.)
- Once the user has entered their information, when they click the Write Cookie button, the `cookies.php` script executes.
- The XHTML document and the PHP script are shown on the next pages. The XHTML document `cookies.html` is on page 36 and the PHP script `cookies.php` appears on page 37.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

```
<!-- cookies.html -->
```

```
<!-- Writing a Cookie -->
```

```
<html xmlns = "http://www.w3.org/1999/xhtml">
```

```
  <head> <title>Writing a cookie to the client computer</title> </head>
```

```
  <body style = "font-family: arial, sans-serif;
  background-color: #856363" background=image1.jpg>
  <h2>Click Write Cookie to save your cookie data.</h2>
```

```
  <form method = "post" action = "cookies.php" style = "font-size: 10pt"
    background-color: #856363">
```

```
    <strong>Name:</strong><br />
```

```
    <input type = "text" name = "NAME" /><br />
```

```
    <strong>Height:</strong><br />
```

```
    <input type = "text" name = "HEIGHT" /><br />
```

```
    <strong>Favorite Color:</strong><br />
```

```
    <input type = "text" name = "COLOR" /><br />
```

```
    <p>
```

```
      <input type = "submit" value = "Write Cookie" style = "background-color: #0000FF;
      color: yellow; font-weight: bold" /></p>
```

```
  </form>
```

```
</body> </html>
```

```

<?php
// cookies.php
// Program to write a cookie to a client's machine
extract( $_POST );
// write each form field's value to a cookie and set the
// cookie's expiration date
setcookie( "Name", $NAME, time() + 60 * 60 * 24 * 5 );
setcookie( "Height", $HEIGHT, time() + 60 * 60 * 24 * 5 );
setcookie( "Color", $COLOR, time() + 60 * 60 * 24 * 5 );
?>

```

Function setcookie sets the cookies to the values passed from the cookies.html form. Function setcookie prints XHTML header information and therefore it needs to be called before any other XHTML (including comments) is printed.

```

<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">

```

```

<html xmlns = "http://www.w3.org/1999/xhtml">
<head> <title>Cookie Saved</title> </head>
<body style = "font-family: arial, sans-serif", background=image1.jpg>
<p><b>The cookie has been set with the following data:</b></p>
<!-- print each form field's value -->
<br /><span style = "color: blue">Name:</span>
<?php print( $NAME ) ?><br />
<span style = "color: blue">Height:</span>
<?php print( $HEIGHT ) ?><br />
<span style = "color: blue">Favorite Color:</span>
<span style = "color: <?php print( "$COLOR\">$COLOR" ) ?>
</span><br />
<p>Click <a href = "readCookies.php">here</a> to read the saved cookie.</p>
</body> </html>

```

The third argument to setcookie is optional and indicates the expiration date of the cookie. In this case it is set to expire 5 days from the current time. Function time returns the current time and then we add to this the number of seconds after which the cookie is to expire.

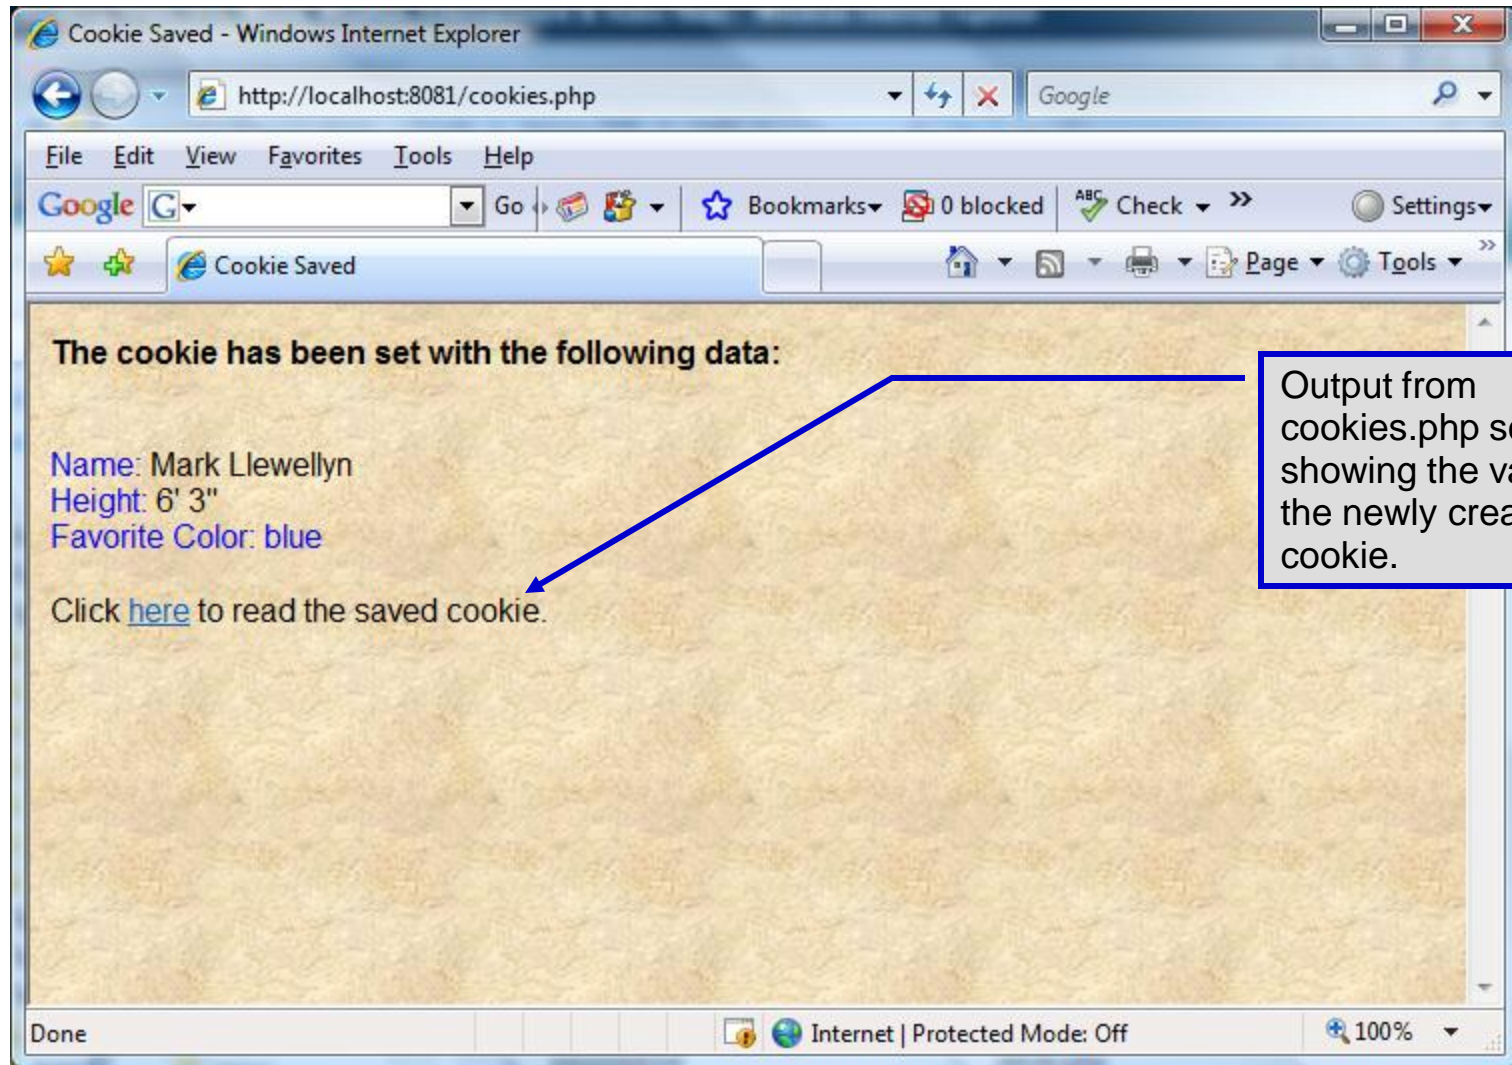

# Cookies (cont.)

# Cookies (cont.)

Output from cookies.php script showing the values in the newly created cookie.

# Cookies (cont.)

- Once the cookie has been created, the cookies.php script gives the user the chance to view the newly created cookie by invoking the readCookies.php script from within the cookies.php script by clicking on the link.
- The readCookies.php script code is illustrated on the next page followed by the output from the execution of this PHP script.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

```
<!-- readCookies.php -->
<!-- Program to read cookies from the client's computer -->
```

```
<html xmlns = "http://www.w3.org/1999/xhtml">
<head><title>Read Cookies</title></head>
```

```
<body style = "font-family: arial, sans-serif" background=image1.jpg>
<p>
<strong> The following data is saved in a cookie on your computer.
</strong>
</p>
<table border = "5" cellspacing = "0" cellpadding = "10">
```

```
<?php
// iterate through array $_COOKIE and print
// name and value of each cookie
foreach ( $_COOKIE as $key => $value )
print( "<tr>
<td bgcolor=#F0E68C>$key</td>
<td bgcolor=#FFA500>$value</td>
</tr>" );
?>
</table>
</body> </html>
```

Superglobal array  
holding cookie.

# Cookies (cont.)

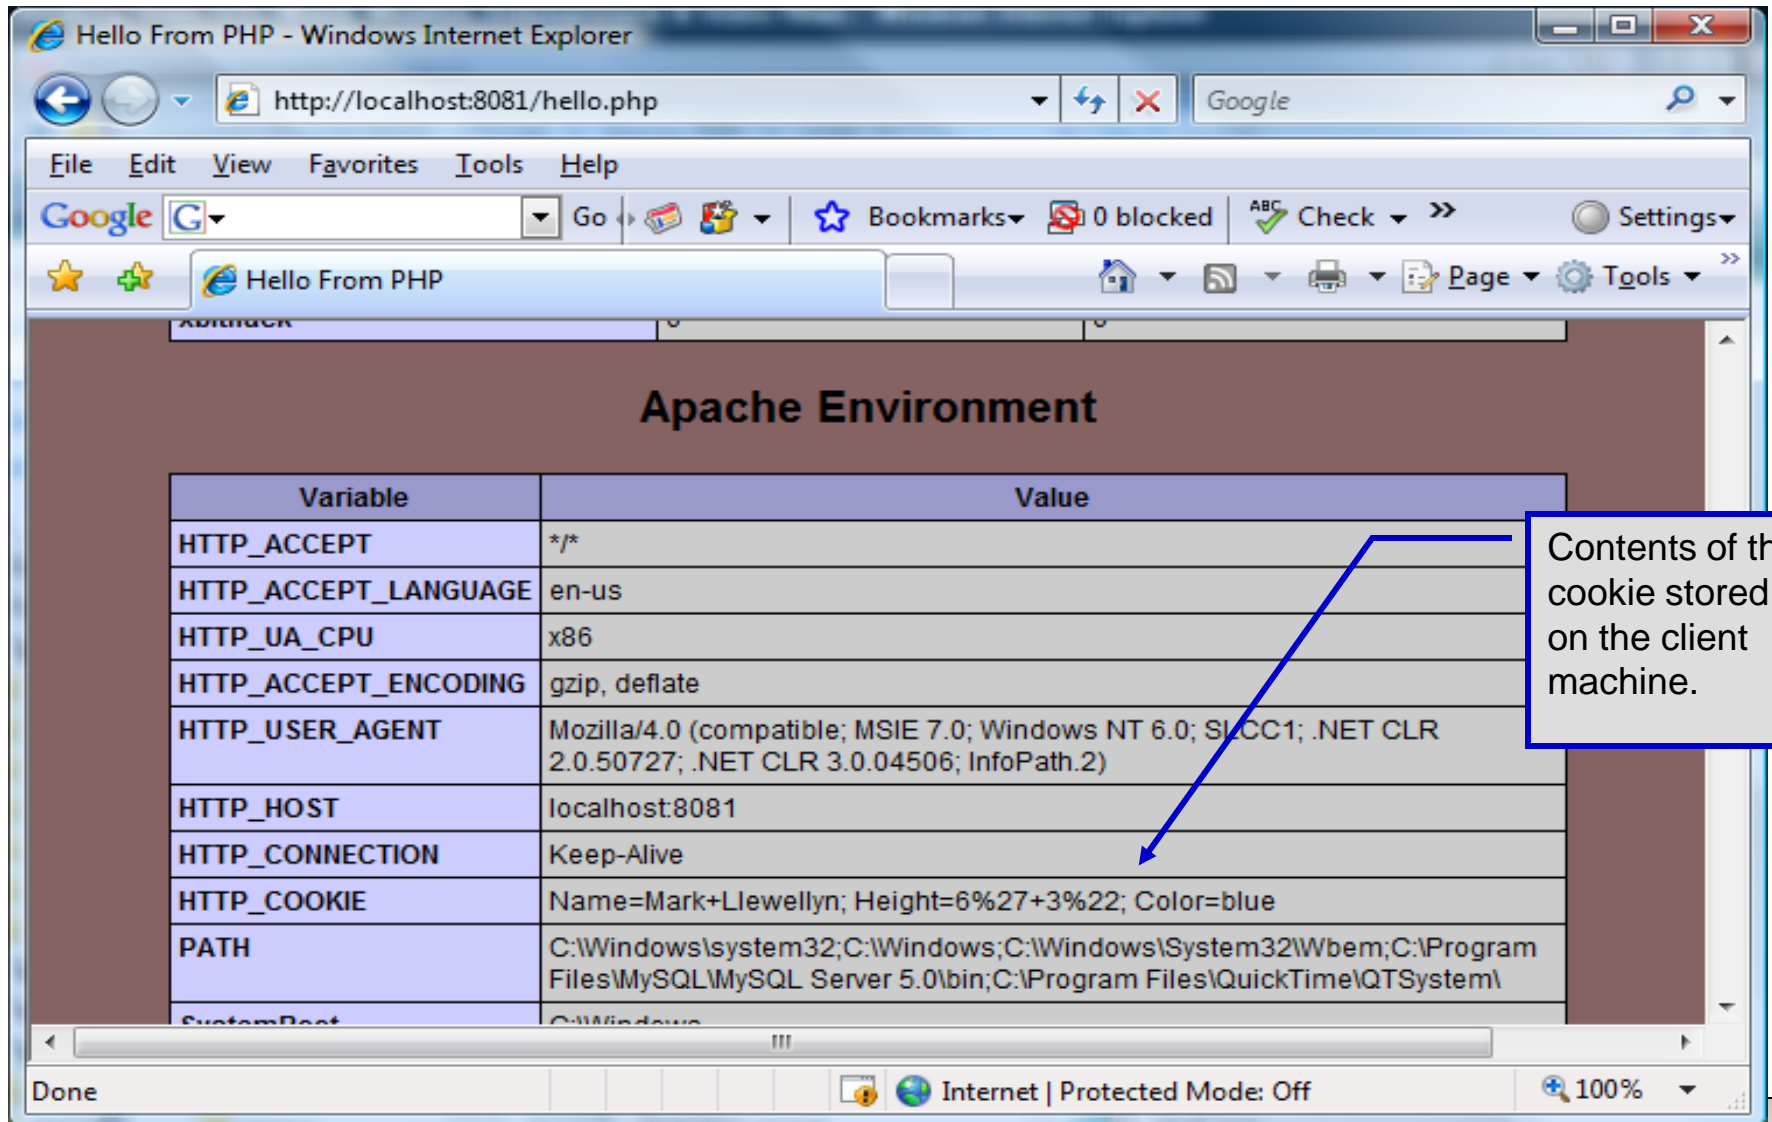

The following data is saved in a cookie on your computer.

Name	Mark Llewellyn
Height	6' 3"
Color	blue

Output from the readCookies.php script.

# Cookies (cont.)

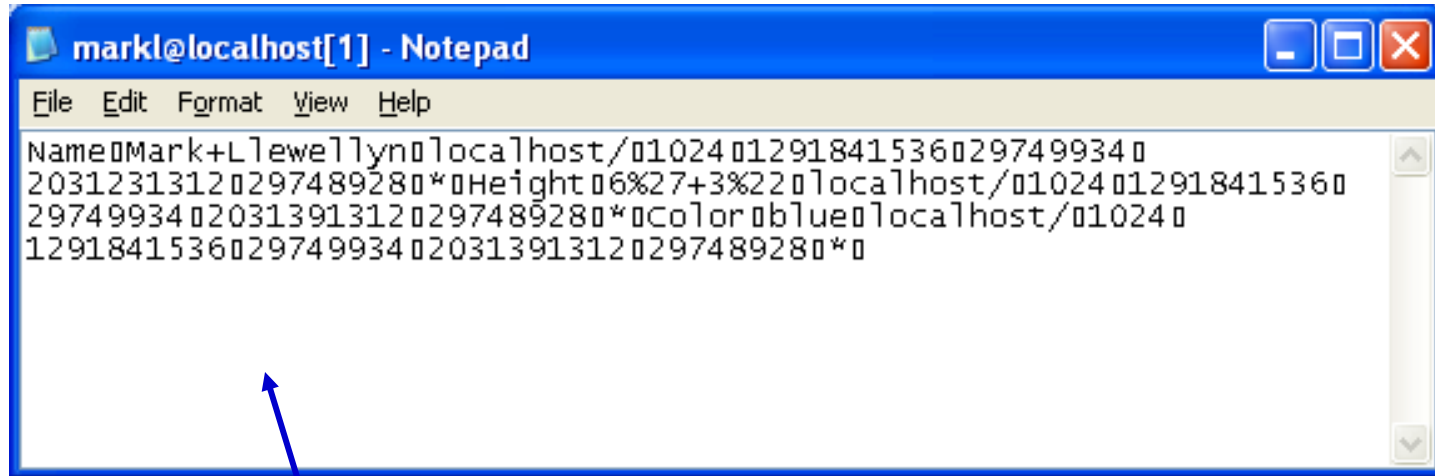

The screenshot shows a Windows Internet Explorer browser window displaying the Apache Environment table. The table lists various HTTP headers and their values. A callout box with a blue arrow points to the 'HTTP\_COOKIE' row, which contains the text 'Name=Mark+Llewellyn; Height=6%27+3%22; Color=blue'. The callout box contains the text: 'Contents of the cookie stored on the client machine.'

Variable	Value
HTTP_ACCEPT	*/*
HTTP_ACCEPT_LANGUAGE	en-us
HTTP_UA_CPU	x86
HTTP_ACCEPT_ENCODING	gzip, deflate
HTTP_USER_AGENT	Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 6.0; SLCC1; .NET CLR 2.0.50727; .NET CLR 3.0.04506; InfoPath.2)
HTTP_HOST	localhost:8081
HTTP_CONNECTION	Keep-Alive
HTTP_COOKIE	Name=Mark+Llewellyn; Height=6%27+3%22; Color=blue
PATH	C:\Windows\system32;C:\Windows;C:\Windows\System32\Wbem;C:\Program Files\MySQL\MySQL Server 5.0\bin;C:\Program Files\QuickTime\QTSystem\
SystemRoot	C:\Windows

# Cookies (cont.)

A screenshot of a Notepad window titled "markl@localhost[1] - Notepad". The window contains the following text:

```
Name=Mark+Llewellyn@localhost/01024012918415360297499340
20312313120297489280*0Height=6%27+3%220localhost/01024012918415360
29749934020313913120297489280*0Color=blue0localhost/010240
1291841536029749934020313913120297489280*
```

Actual text file holding cookie data for the cookie that was created in this example.

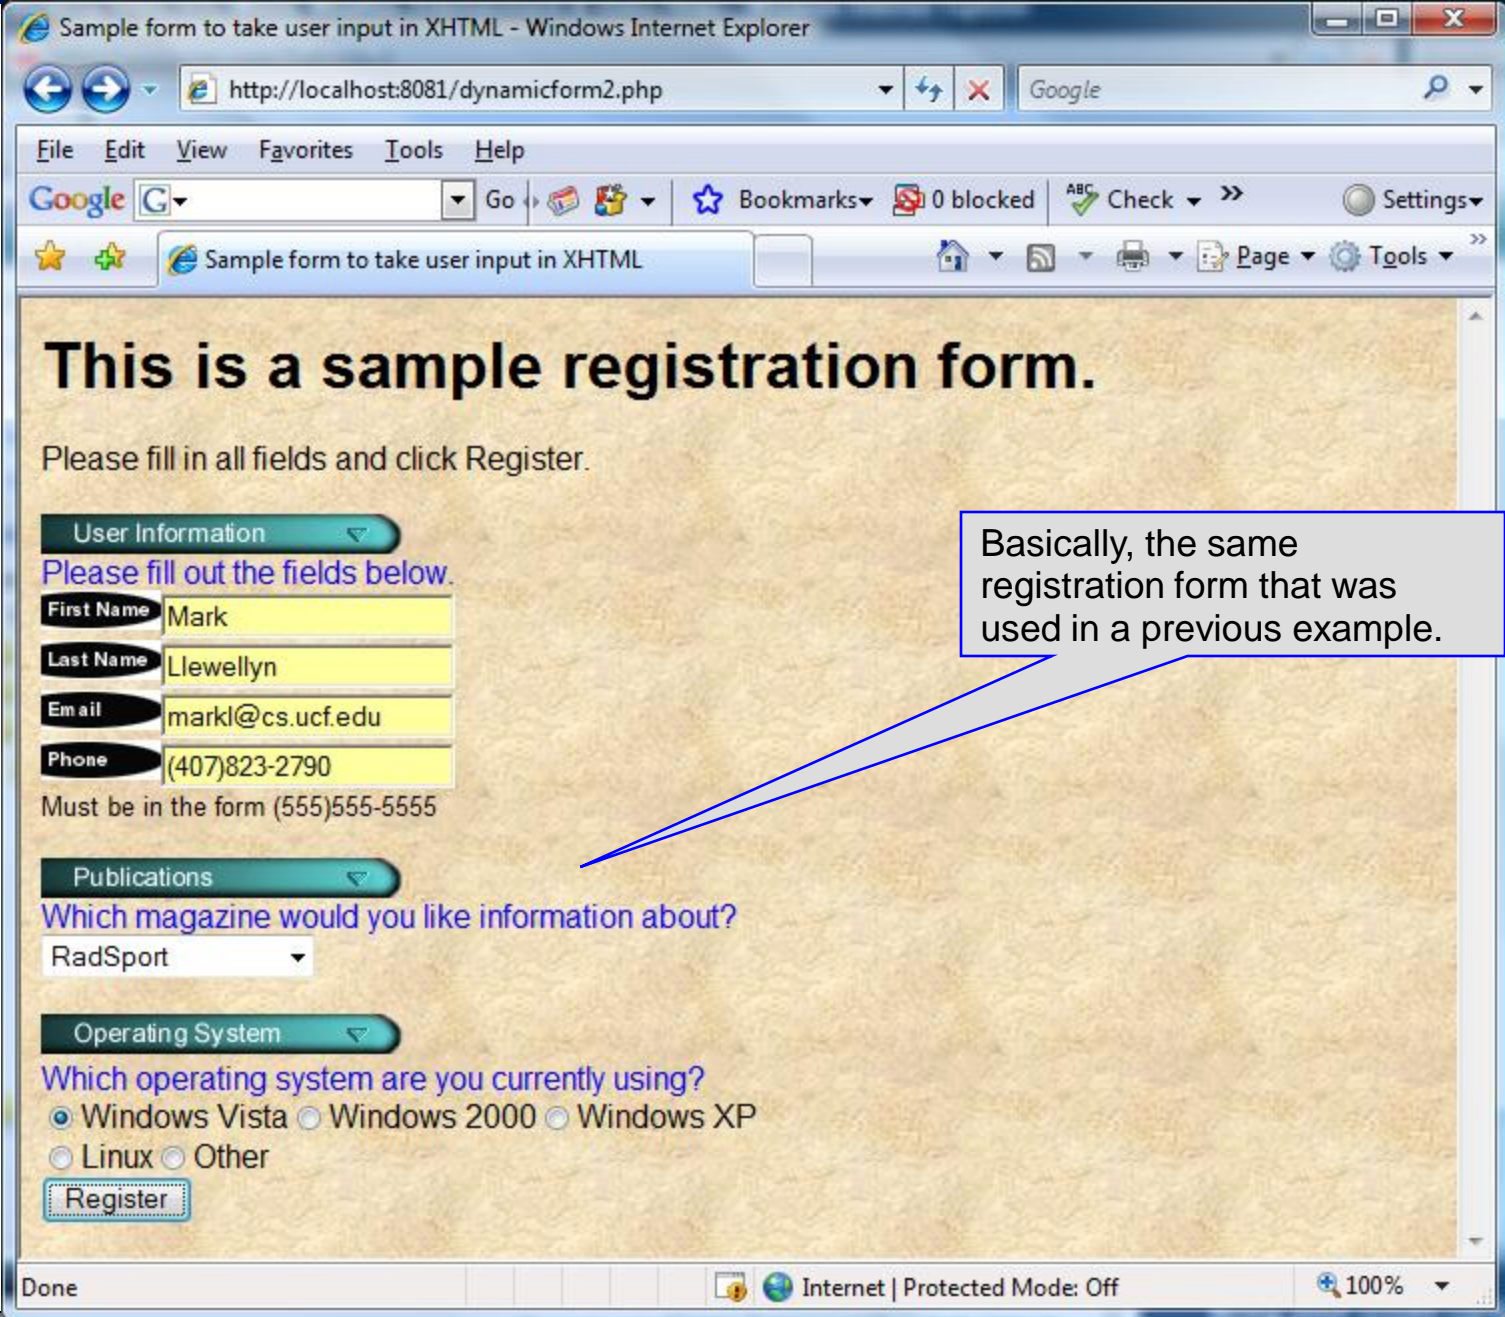

# Dynamic Content in PHP

- Of all the strengths PHP exhibits as a server-side scripting language, perhaps its greatest strength lies in its ability to dynamically change XHTML output based on user input.
- In this final section of notes, we'll build on the examples we've constructed in the previous two sets of notes by combining `form.html` and `form.php` into one dynamic PHP document named `dynamicForm2.php`.
- We'll add error checking to the user input fields and inform the user of invalid entries on the form itself, rather than on an error page. If an error exists, the script maintains the previously submitted values in each form element.
- Finally, after the form has been successfully completed, we'll store the input from the user in a MySQL database.

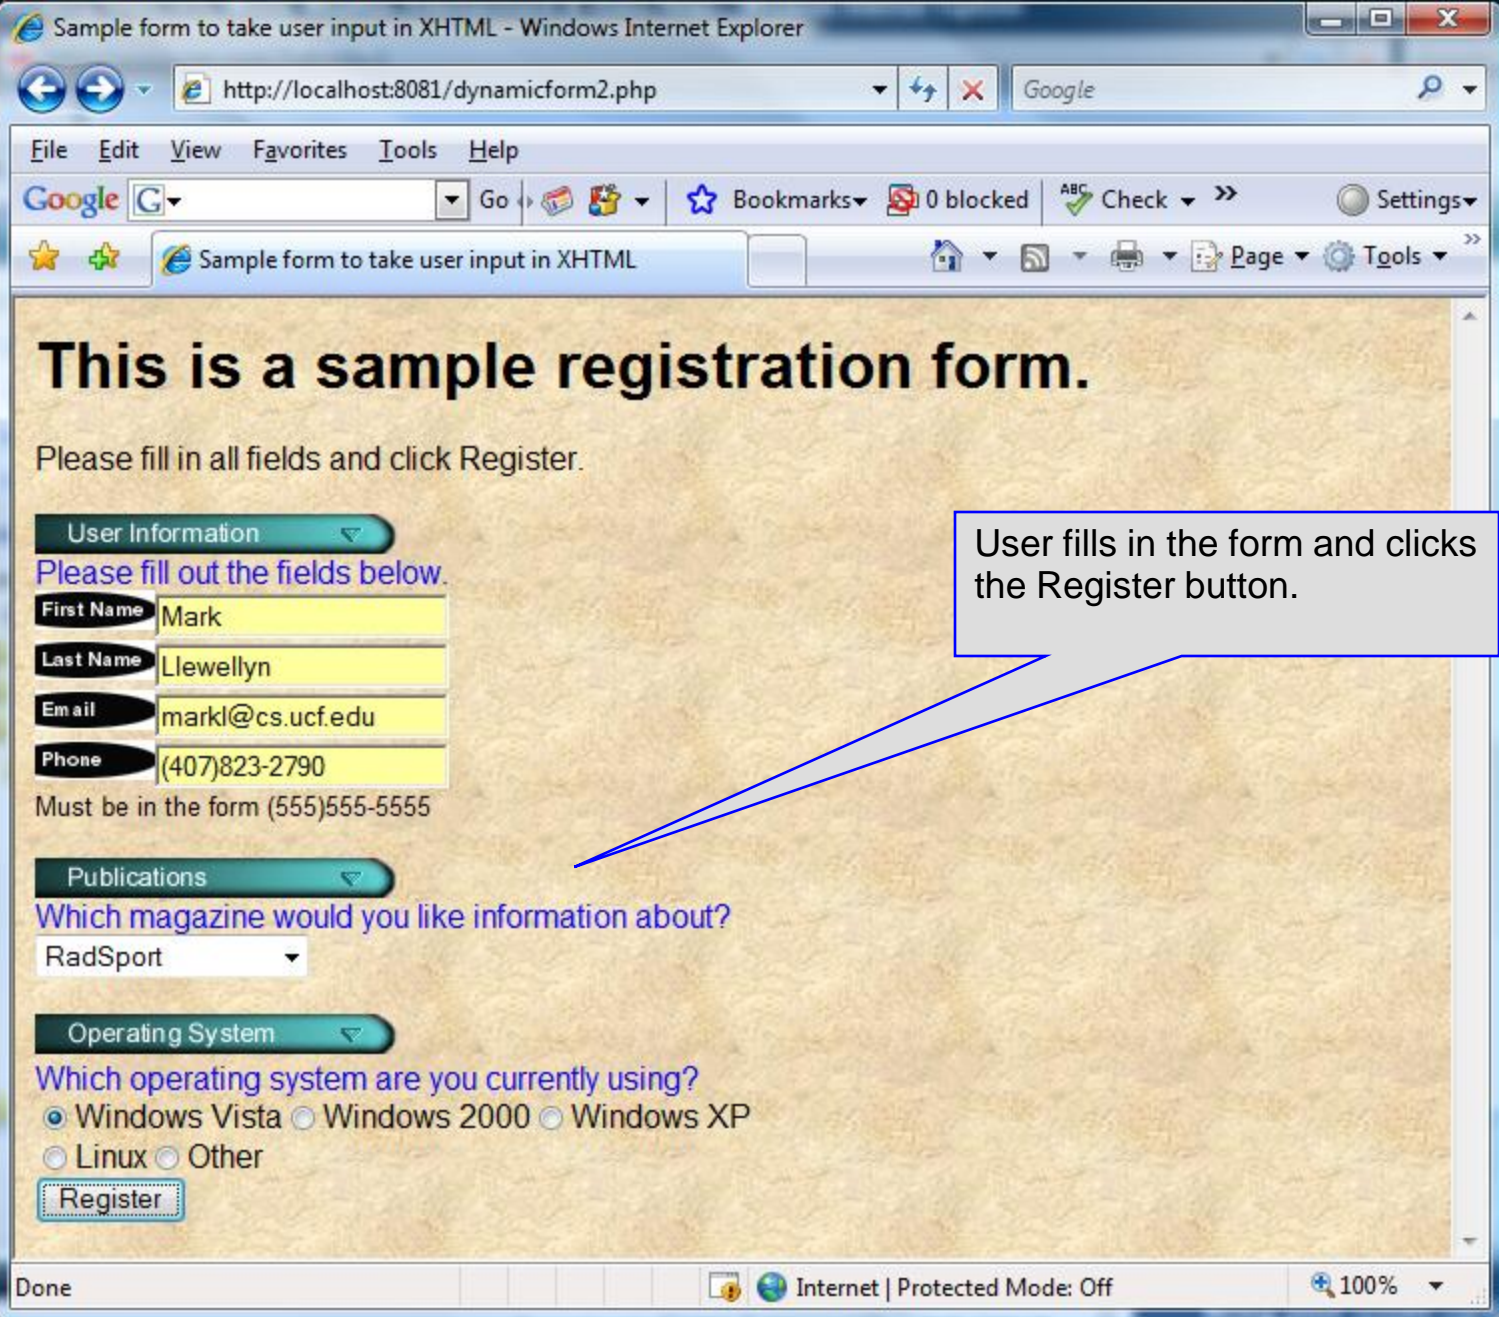

Basically, the same registration form that was used in a previous example.

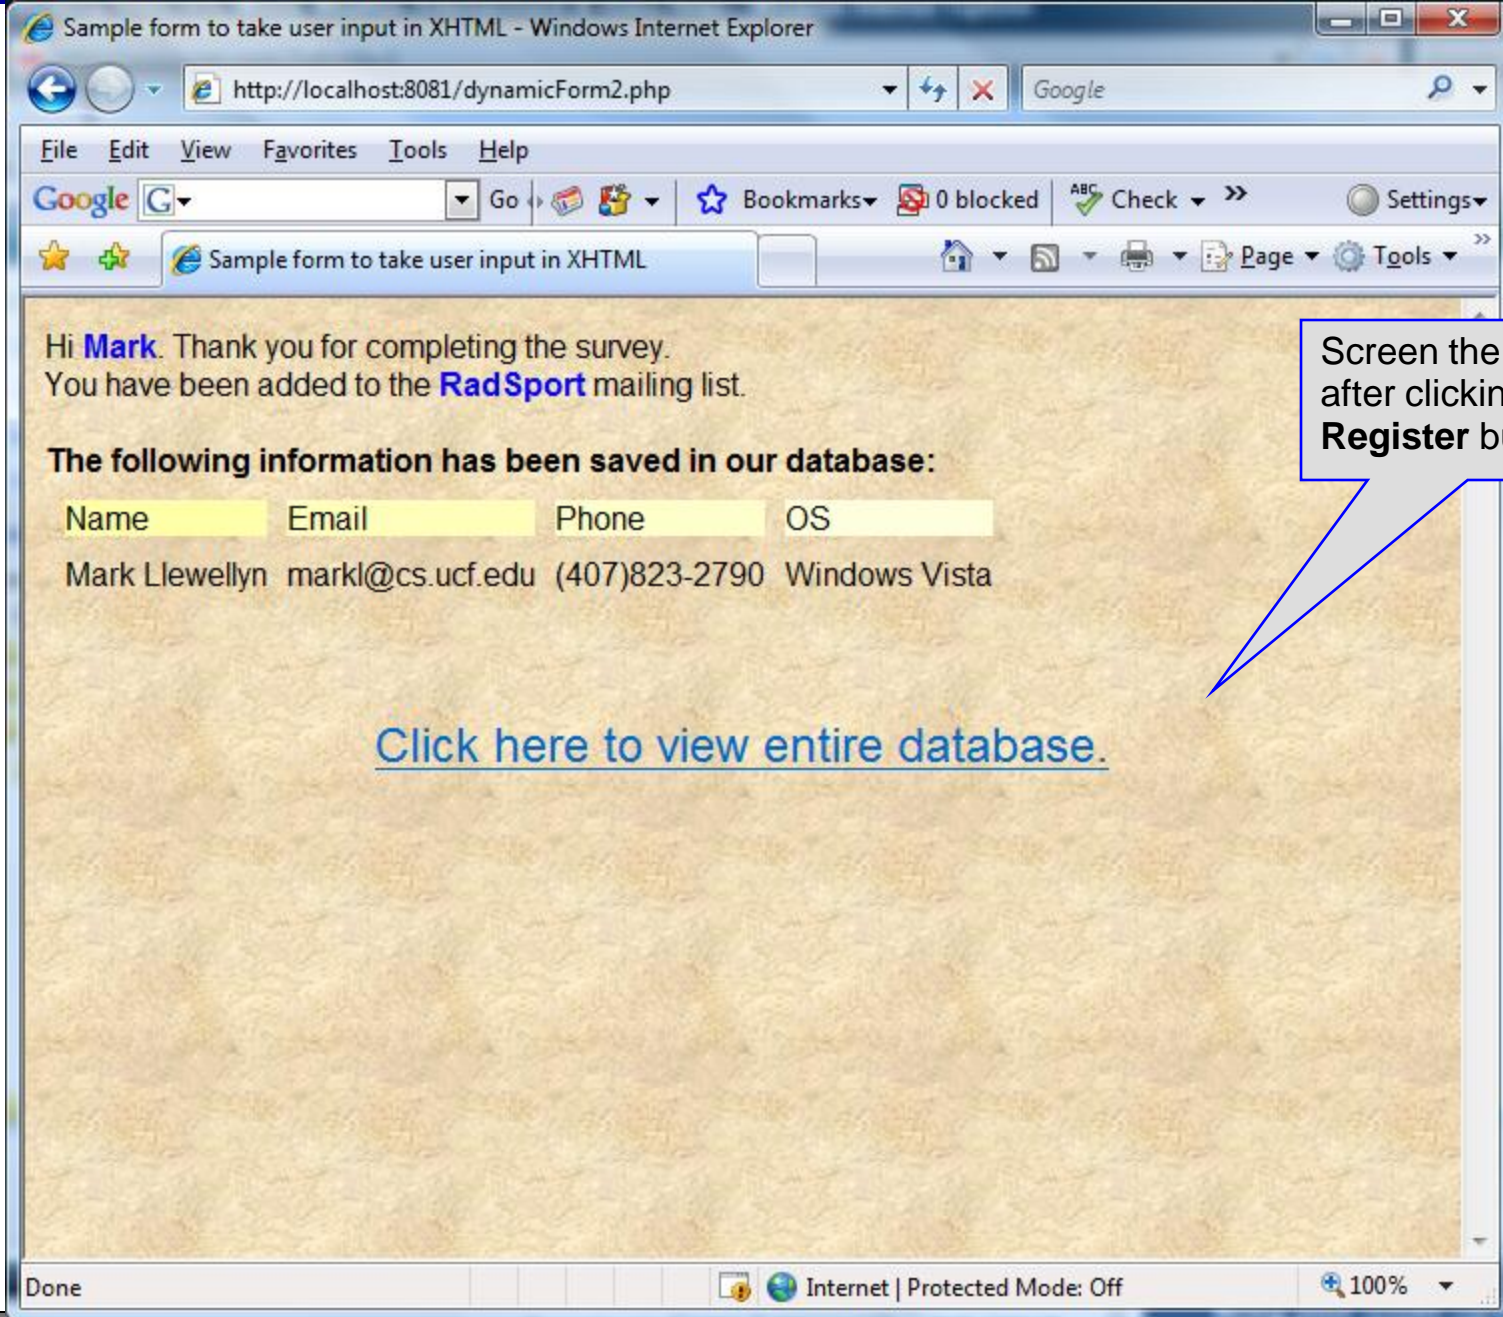

User fills in the form and clicks the Register button.

Please fill out the fields below.

First Name  \*  
Last Name   
Email   
Phone   
Must be in the form (555)555-5555

**Publications**  
Which magazine would you like information about?  
Velo-News

**Operating System**  
Which operating system are you currently using?  
 Windows Vista  Windows 2000  Windows XP  
 Linux  Other

Register

Done Internet | Protected Mode: Off 100%

Dynamic nature of the PHP form is illustrated when the user fails to enter proper information into the form. In this case, the user forgot to enter their first name. Error checking is in place on each user input location and the page is dynamically updated to reflect the error processing and correction capabilities. The database will not be updated until the user has correctly filled in all required fields.

```

Invoke PHP script to see contents of entire database if user clicks this link. Code begins on page 14.

The form created is self-submitting (i.e., it posts to itself). This is done by setting the action to dynamicForm2.php

```

<!-- create four text boxes for user input -->" );
foreach ( $inputlist as $inputname => $inputalt ) {
    $inputtext = $inputvalues[ $inputname ];

    print( "<img src = 'images/$inputname.gif'

    if ( $formerrors[ ( $inputname )."error" ] == true )
        print( "<span style = 'color : red'>*</span>" );
    print( "<br />" );
}
print( "<span style = 'font-size : 10pt" );
if ( $formerrors[ "phoneerror" ] ) print( "; color : red" );
print( "">Must be in the form (555)555-5555
    </span><br /><br />
    <img src = 'images/downloads.gif'
    alt = 'Publications' /><br />
    <span style = 'color: blue'>
    Which magazine would you like information about?
    </span><br />
    <!-- create drop-down list containing magazine names -->
    <select name = 'mag'>" );
foreach ( $maglist as $currmag ) {
    print( "<option" );
    if ( ( $currmag == $mag ) )
        print( " selected = 'true'" );
    print( ">$currmag</option>" );
}

```

The \$\$variable notation specifies variable variables. PHP permits the use of variable variables to allow developers to reference variables dynamically. The expression \$\$variable could also be written as \${\$variable} for added clarity.

```
