## Counting Systems – Basic Info

#### Regular Counting System

- Known as Decimal
- also known as base 10
- Do you know why it is called base 10?
  - If you said, "because it has ten counting digits":
    - 0, 1, 2, 3, 4, 5, 6, 7, 8, and 9
  - You are right!
  - To count in base ten, you go from 0 to 9
  - Then you count in combinations of two digits starting with 10 all the way to 99
  - After 99 comes three-digit combinations from 100 999, etc.

## Counting Systems – Basic Info

#### Regular Counting System

Let's examine a decimal number:

Thousands place Hundreds place Tens place Ones place

2713

- When we break down this number, we have:
  - 2 "thousands" + 7 "hundreds" + 1 "tens" + 3 "ones
  - 2000 + 700 + 10 + 3
- Let's see, in detail, how we get this

## Counting Systems – Basic Info

#### Regular Counting System

- The decimal number 2713:
- When we break down this number, we have:
  - 2000 + 700 + 10 + 3
- Where does the 2000 come from?
  - How do we get 2000?
- Mathematically,
  - We said this means we have two "thousands"
  - A thousand is 1000
  - How do we represent 1000, in terms of 10?  $10^3$
  - So 2000 is the same as 2 x 10<sup>3</sup> = 2 x 1000 = 2000

## Counting Systems – Basic Info

#### Regular Counting System

The decimal number 2713:

#### Similarly,

- The next digit, 7, means that we have 7 "hundreds"
  - We have 7, "100"s
- Mathematically, how do we represent 100 in terms of 10?
   10<sup>2</sup>
- So 700 comes from 7x10<sup>2</sup> = 7x100 = 700

## Counting Systems – Basic Info

#### Regular Counting System

- The decimal number 2713:
- Next:
  - The next digit, 1, means that we have 1 "ten"
    - We have 1, "10"
    - Mathematically, we represent this as 10<sup>1</sup>
  - So 10 comes from 1x10<sup>1</sup> = 1x10 = 10

#### Finally:

- The last digit, 3, means that we have 3 "ones"
  - We have 3, "1"s
  - How do we represent 1 in terms of 10? As 10<sup>0</sup>.
- So 3 comes from  $3x10^0 = 3x1 = 3$

## Counting Systems – Basic Info

#### Regular Counting System

- The decimal number 2713:
- Putting this all together,
  - $2713_{10} = 2 \times 10^3 + 7 \times 10^2 + 1 \times 10^1 + 3 \times 10^0$
- What we learn from this:
  - Each digit's value is determined by the place it is in
  - Each <u>place</u> is a perfect power of the base
  - With the least significant at the end
  - Counting up, by 1, as you go through the number from right to left

## Counting Systems – Basic Info

#### Other Counting Systems

At first glance, it may seem that this would be the only possible number system

That is, using 10 digits (0 – 9)

- Turns out, the number of digits used is arbitrary
- We could have chosen to use only 5 digits

• 0-4 (base 5 system)

Look at how we determine the value of a number:

•  $314_5 = 3 \times 5^2 + 1 \times 5^1 + 4 \times 5^0 = 84_{10}$ 

- Guess what???
  - We just converted from base 5 to base 10

## Counting Systems – Basic Info

#### **CONVERT from ANY base to base 10**

- This example illustrates how we can convert from a different base to base 10
- In general, we write the conversion as follows:

 $d_{n-1}d_{n-2}\dots d_2d_1d_{0 \text{ (in base b)}} = d_{n-1}xb^{n-1} + d_{n-2}xb^{n-2} + \dots + d_2xb^2 + d_1xb + d_0$ 

#### Note:

- b based to the 1 and 0 powers were simplified above
- Couple quick examples:
  - $781_9 = 7x9^2 + 8x9^1 + 1x9^0 = 640_{10}$
  - $1110101_2 = 1x2^6 + 1x2^5 + 1x2^4 + 0x2^3 + 1x2^2 + 0x2^1 + 1x2^0 = 117_{10}$
  - This last one was the very common base 2 (binary)

## Counting Systems – Basic Info

Binary (aka base 2)

- MOST common in computer science
- Why?
  - Cuz all your computer "innards" are represented in binary
    - All software ultimately boils down to a binary representation
- So here's a little binary chart to get you going:

Decimal	Binary	Decimal	Binary
1	0001	9	1001
2	0010	10	1010
3	0011	11	1011
4	0100	12	1100
5	0101	13	1101
6	0110	14	1110
7	0111	15	1111
8	1000	16	10000

## Counting Systems – Basic Info

#### Hexadecimal

- The most common base with more than 10 digits
  - Aka base 16
  - Meaning there are <u>16 counting digits</u>
  - WAIT!!!
  - But we <u>only</u> have 10 possible digits to use!
    - 0 through 9
  - So that means we are six digits short!
    - That is correct.
  - It was decided to use the following six additional "digits":
    - A, B, C, D, E, and F

## Counting Systems – Basic Info

#### Hexadecimal

- base 16: use 16 counting digits
  - It was decided to use the following six additional "digits":
    A, B, C, D, E, and F
  - A represents the value 10, B is 11, C is 12, D is 13, E is 14, and F is 15
  - So here is the single digit sequence for base 16:
    - 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

## Counting Systems – Basic Info

#### Hexadecimal

- Benefit of Hexadecimal:
  - Everything internally (in a computer) is stored in base 2
    - binary
  - However, when we view contents of memory
  - Or when we assign values
    - Such as RGB values for colors
  - We often view numbers in hexadecimal
- So it is important to be familiar with hexadecimal
- Also important to be able to convert to and from hexadecimal to other bases

- Conversion from Hexadecimal to Decimal
  - This is done EXACTLY the same as shown previously

• 
$$A3D_{16} = Ax16^2 + 3x16^1 + Dx16^0$$

 $= 10x16^2 + 3x16^1 + 13x16^0 = 2621_{10}.$ 

$$= 2621_{10}$$

- Conversion from Hexadecimal to Binary
  - Note:
    - 16, as in "base 16", is a PERFECT power of 2
    - This makes conversion to base 2 (binary) very EASY
    - Why?
    - Each hexadecimal digit is perfectly represented by 4 binary digits
    - Does that make sense?
    - A base 16 digit can be up to F (which is 15)
    - So, in order to represent, up to 15, in binary
      - We MUST have 4 binary digits
      - From the chart earlier, we know that 15<sub>10</sub> is 1111<sub>2</sub>

#### Conversion from Hexadecimal to Binary

#### Note:

This allows us to make the following "purty" chart showing the conversions from hexadecimal to binary:

Hex:	0	1	2	3	4	5	6	7
<u>Bin:</u>	0000	0001	0010	0011	0100	0101	0110	0111
Hex:	8	9	А	В	С	D	E	F
Bin:	1000	1001	1010	1011	1100	1101	1110	1111

- Using this, we can easily convert from base 16 to base 2
- A3D<sub>16</sub> = 1010 0011 1101<sub>2</sub>
- F4BC72<sub>16</sub> = 1111 0100 1011 1100 0111 0010 0001 0110<sub>2</sub>

## Base Conversion Methods

#### **CONVERT from ANY base to base 10**

- We already went over this one
- In general, the conversion is as follows:
  - $d_{n-1}d_{n-2}\dots d_2d_1d_{0 \text{ (in base b)}} = d_{n-1}xb^{n-1} + d_{n-2}xb^{n-2} + \dots + d_2xb^2 + d_1xb^1 + d_0xb^0$
- Some quick examples:
  - $246_7 = 2x7^2 + 4x7^1 + 6x7^0 = 132_{10}$
  - $781_9 = 7x9^2 + 8x9^1 + 1x9^0 = 640_{10}$
  - $30122_4 = 3x4^4 + 0x4^3 + 1x4^2 + 2x4^1 + 2x4^0 = 794_{10}$
  - $1110101_2 = 1x2^6 + 1x2^5 + 1x2^4 + 0x2^3 + 1x2^2 + 0x2^1 + 1x2^0 = 117_{10}$
  - This last one was the very common base 2 (binary)

## **Base Conversion Methods**

#### **Conversion from Decimal to Binary**

- Given the number 27<sub>10</sub>
  - Convert it to binary
- Basically, we start by dividing 27 by 2
  - Integer Division!
    - Remember, 27/2 would be 13
  - So, 27/2 is 13 with a remainder of 1
- We then divide 13 by 2
  - 13/2 is 6 with a remainder of 1
- Continue this process until you get 1
  - At that point, you will have 1/2 is 0 with a remainder of 1

Conversion from Decimal to Binary
 Convert 27<sub>10</sub> to binary

27/2 = 13	with a remainder of	1
13/2 = 6	with a remainder of	1
6/2 = 3	with a remainder of	
3/2 = 1	with a remainder of	1
1/2 = 0	with a remainder of	1

So,  $27_{10}$  is the same as  $11011_2$ 

- You stop when you get 0 as an answer
  - Of course, the final remainder will be 1
- Now, how do you determine the equivalent binary # ?
  - Read the remainders from bottom to top!

## Base Conversion Methods

- Conversion from Decimal to Binary
  - Another example: Convert 117<sub>10</sub> to binary

117/2 = 58	with a remainder of	1
58/2 = 29	with a remainder of	0
29/2 = 14		1
14/2 = 7	with a remainder of	
7/2 = 3	with a remainder of	1
3/2 = 1	with a remainder of	1
1/2 = 0	with a remainder of	1

So, 117<sub>10</sub> is the same as 1110101<sub>2</sub>

- You stop when you get 0 as an answer
- Read the remainders from bottom to top to get binary #

#### **Conversion from Decimal to Any Other Base**

- The previous example worked great for base 2
- Turns out that this method is not specific to base 2
- Meaning, the same logic can be applied to convert from decimal to ANY other base!
- Let's look at a couple of examples...

Conversion from Decimal to Any Other Base
 Convert 381<sub>10</sub> to base 16 (hexadecimal)

381/16 = 23 with a remainder of 13 (D)23/16 = 1 with a remainder of 7 (D)1/16 = 0 with a remainder of 1 (D)

- Start by dividing 381 by the BASE (to convert to)
- SAME idea: you stop when you get 0 as an answer
  - The final remainder could be anything 1 through 15 (F)
- Now, how do you determine the equivalent <u>base 16</u> # ?
  - Read the remainders from bottom to top!

So, 381<sub>10</sub> is

the same

as 17D<sub>16</sub>

## Base Conversion Methods

#### Conversion from Decimal to Any Other Base

Convert 175<sub>10</sub> to base 3 (ternary)

175/3 = 58with a remainder of158/3 = 19with a remainder of119/3 = 6with a remainder of16/3 = 2with a remainder of02/3 = 0with a remainder of2

- Again, start by dividing 175 by the BASE (to convert to)
- SAME idea: you stop when you get 0 as an answer
  - In this case, the final remainder could be 1 or 2
- Now, how do you determine the equivalent <u>base 3</u> # ?
  - Read the remainders from bottom to top!

So, 175<sub>10</sub> is

the same

as 20111<sub>3</sub>

## **Base Conversion Methods**

- Generic Conversion Process
  - Convert from ANY base (call it B1)
  - To ANY to other base (call it B2)
    - where NEITHER of the bases are base 10
  - This is a two step process:
  - 1) Convert from B1 to base 10
  - 2) Convert from base 10 to B2
  - How to do this should be straightforward:
    - You simply utilize <u>both</u> of the methods already shown

Generic Conversion Process

- Convert 125<sub>7</sub> to base 4
- This is a two step process:
- 1) Convert 125<sub>7</sub> to base 10

- $125_7 = 1x7^2 + 2x7^1 + 5x7^0 = 68_{10}$
- Refer to slide 17 for a reminder of how to do this step if there is confusion

Generic Conversion Process
 Convert 125<sub>7</sub> to base 4
 This is a two step process:
 Now, convert 68<sub>10</sub> to base 4

Final Answer:  $125_7$  converts to  $1010_4$ 

#### Solution:

68/4 = 17with a remainder of017/4 = 4with a remainder of14/4 = 1with a remainder of01/4 = 0with a remainder of1

So,  $125_7$  is the same as  $68_{10}$ , which is the same as  $1010_4$ 

#### Generic Conversion Process

- If you are converting between two bases (B1 & B2) that are BOTH a perfect power of 2
- You can use the method we just showed.
- But the following process works more quickly:
- 1) Convert from B1 to base 2
- 2) Convert from base 2 to B2
- Part 1 should be straightforward:
- We just need to briefly look at Part 2

## Base Conversion Methods

Generic Conversion Process

- Convert A3D<sub>16</sub> to base 8 (octal)
  - Notice they are both perfect powers of 2
- This is a two step process:
- 1) Convert A3D<sub>16</sub> to base 2

- For this part, we just put the binary equivalent of each digit
- A3D<sub>16</sub> = 1010 0011 1101<sub>2</sub>

## **Base Conversion Methods**

**Generic Conversion Process** 

- Convert A3D<sub>16</sub> to base 8 (octal)
  - Notice they are both perfect powers of 2
- This is a two step process:
- 2) Now, convert 1010 0011 1101<sub>2</sub> to base 8

- Think:
  - How many possible counting digits are there in base 8?
  - DUH!
  - There are 8! Hence base 8! They are 0 through 7.

## **Base Conversion Methods**

#### **Generic Conversion Process**

- Convert A3D<sub>16</sub> to base 8 (octal)
  - Notice they are both perfect powers of 2
- This is a two step process:
- 2) Now, convert 1010 0011 1101<sub>2</sub> to base 8

- Think:
  - Now, how many binary digits does it take to perfectly represent one octal (base 8) digit?
  - Three!
  - Why? Cuz 8 = 2<sup>3</sup>

## **Base Conversion Methods**

**Generic Conversion Process** 

- Convert A3D<sub>16</sub> to base 8 (octal)
  - Notice they are both perfect powers of 2
- This is a two step process:
- 2) Now, convert 1010 0011 1101<sub>2</sub> to base 8

- So group the binary digits, in SETS OF THREE
  - From right to left
- Then convert each set of three binary digits to its octal equivalent

## **Base Conversion Methods**

**Generic Conversion Process** 

- Convert A3D<sub>16</sub> to base 8 (octal)
  - Notice they are both perfect powers of 2
- This is a two step process:
- 2) Now, convert 1010 0011 1101<sub>2</sub> to base 8

#### Solution:

1010 0011 1101<sub>2</sub>

Final Answer: A3D<sub>16</sub> converts to 5075<sub>8</sub>

- Just rewrite this with different spacing: <u>101 000 111 101</u>
- Convert each set of three digits:
- 5075<sub>8</sub>

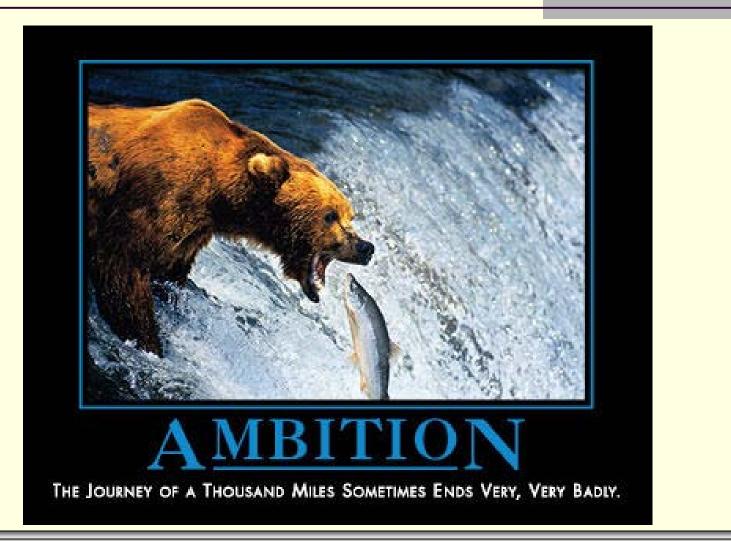

**Base Conversions**
