

COP 3503 Honors – Homework 7 (Collaborative)

Due Date: November 20, 2017

1. Modify Dijkstra's algorithm so that it checks if a given directed graph $G = (V, E)$ has a cycle. Give the pseudocode and analyze the performance.
2. Assume that for a given weighted directed graph $G = (V, E)$, the shortest path from s to any other vertex contains at most m edges. Show how to modify the Bellman-Ford algorithm to take advantage of this information. Give the pseudocode.

Extra Credit

How can we use the output of the Floyd-Warshall algorithm to detect the presence of a negative weight cycle?
