

Password Security: A Case History by Robert Morris and Ken Thompson (Bell Labs)

Presented by Matthew
Little

What is the Presentation?

I. Brief Intro

**II. Early Design
Flaws**

III. Attacks

**IV. Solutions and
Current State**

V. Conclusion

The Beautiful Struggle

“This competition has been in the same vein as the competition of long standing between manufacturers of armor plate and those of armor piercing shells.”

Origins

Early Attempts at password security had serious flaws. Old versions of Unix used a clear text password file.

What if the Wu Tang Clan had an old Unix Server?

Their password file might look like this:

```
olympus.acs.ucf.edu - PuTTY
UW PICO(tm) 4.6
root:supersecret:0:1:Super-User:/:/bin/ksh
methodman:tical:6:1:User:/:/bin/ksh
ODB:RIP:6:1:User:/:/bin/ksh
ghostfacekilla:supreme_clientel:6:1:User:/:/bin/ksh
raekwon:icecream:6:1:User:/:/bin/ksh
ugod:goldenarms:6:1:User:/:/bin/ksh
inspectadeck:who?:6:1:User:/:/bin/ksh
Gza:liquidwords:6:1:User:/:/bin/ksh
```

Cool Dude...so what's the problem?

At MIT, in the early 60's, a software bug caused *the password file to be* printed on every terminal when it was logged into.

Back that File Up?

In the old days they were backing up their files on magnetic tape, so anyone with physical access to the tape could read anything on it with no restrictions.

Spies have broken into a magnetic tape archive. They are reading and stealing passwords for malicious use.

We're talkin Remote Login?

Some programs used to log into remote servers, programs such as telnet, have a huge design flaw.

Clear Text

READ ME!

Worst Idea Ever!!!!!!!!!!

Smells like Hacker Spirit

Because we are logging in 'remotely', we have to worry about 'Sniffers' (people monitoring the traffic on the network...looking for passwords sent in 'clear text'.)

Some Body Dial 911

Because we OBVIOUSLY need help

Encryption to the Rescue!

Even if they can see your password, it won't help.

“I don't even see the code...all I see is Blonde, Brunette, Redhead...”-Cypher

One way Hash to protect your...PASS

Password Enter
ThereIsNoSpoon

Cryptword Leave
AD43V4EV43V

The UNIX crypt () function takes the user's password as the encryption key and uses it to encrypt a 64-bit block of zeros. The resulting 64-bit block of text is then encrypted again with the user's password; the process is repeated a total of 25 times. The final 64 bits are unpacked into a string of 11 printable characters that are stored in the /etc/passwd file.

Wu Tang Clan ain't nothin to Hash wit?

```
olympus.acs.ucf.edu - PuTTY
UW PICO(tm) 4.6

root:adf8134FSE24V#$$%3S&FBA1=:0:1:Super-User:/:/bin/ksh
methodman:ADF234723FS4#!45AS1=:6:1:User:/:/bin/ksh
ODB:ASKVF783BFGDF8424DFS=:6:1:User:/:/bin/ksh
ghostfacekilla:YY834XC34SDFN430#&FG=:6:1:User:/:/bin/ksh
raekwon:34V834934JFF9D72346=:6:1:User:/:/bin/ksh
ugod:L458GFG34543GDW434=:6:1:User:/:/bin/ksh
inspectadeck:34543VDF534GFD345=:6:1:User:/:/bin/ksh
```

Who's on First!

Username: **Neo** Password: **ThereIsNoSpoon**

Crypt() 2. Encrypt entered password

1. Search for username

Cryptword: **34dfkj3494fasr**

Password File

```
root:as34rc4sdf3
methodman:f34csr34f
Neo:34dfkj3494fasr
```

3. Compare Cryptword result from entered password with what is stored in password file. If they match, login is successful!

“I'm Winston Wolf, I solve problems.”

With **Encryption**, we can allow **access** to the password file and **send encrypted passwords** over the network and not worry about a thang...right?

Kieeee Yaaaahhh...Dictionary Attack!

We are still vulnerable to "Dictionary Attacks"!

Sticks and Stones...

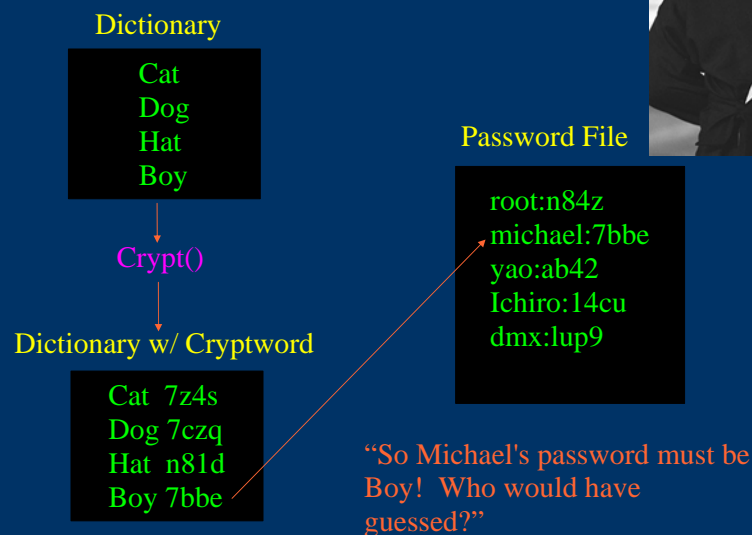

Hackers know the Encryption Algorithm. The Unix source code is readily available.

They use a “Dictionary”, a compiled catalog of likely Passwords.

Then they encrypt their dictionary of words using the same algorithm crypt().

Finally, with access to the password file, they search for encrypted matches...gotta match? gotta password!

“I know Kung Fu”-Neo “...Show Me”-Morpheus

Shake it like a Salt Shaker

The System can extend passwords by appending a 'Salt'. The 'Salt' is a 12-bit number between 0-4095. That means the same password can encrypt in 4096 different ways.

Username: **Neo**
Password w/o Salt: **ThereIsNoSpoon**
Cryptword: **AD43V4EV43V**

Pick a 'Salt' based on the time of day

Password w/ Salt: **ThereIsNoSpoon0, ThereIsNoSpoon1, ThereIsNoSpoon2, etc**
Cryptword: **BAI4BYZ4B4K, DJOE4N47XTYW, EXYE2845SS78G, etc**

Player Haters

Cat 7z4s
Dog 7czq
Hat n81d
Boy 7bbe

4 Entries

With 'Salt', Dictionary size must be increased by a factor of 4096

Cat0, Cat1, Cat2, ..., Cat4095
Dog0, Dog1, Dog2, ..., Dog4095
Hat0, Hat1, Hat2, ..., Hat4095
Boy0, Boy1, Boy2, ..., Boy4095

$4 \times 4096 = 16384$ Entries

16K+ Entries for a Dictionary of just 4 likely Passwords!

You Can't Hack What You Can't See

Shadow Files have restricted permissions that prevent them from being read by intruders. The encrypted password is stored only in the shadow password file, `/etc/shadow`, and not in the `/etc/passwd` file. The `passwd` file is maintained as a world-readable file because it contains information that various programs use. The shadow file can only be read by root and it does not duplicate the information in the `passwd` file. It only contains passwords and the information needed to manage them.

Now Wu Tang Clan ain't nothin to hack wit!

The Password File has become totally useless to hackers

```
olympus.acs.ucf.edu - PuTTY
UW PICO(tm) 4.6
root:x:0:1:Super-User:/:/bin/ksh
methodman:x:6:1:User:/:/bin/ksh
ODB:x:6:1:User:/:/bin/ksh
ghostfacekilla:x:6:1:User:/:/bin/ksh
raekwon:x:6:1:User:/:/bin/ksh
ugod:x:6:1:User:/:/bin/ksh
inspectadeck:x:6:1:User:/:/bin/ksh
```

Instead of holding clear text passwords or Cryptwords, it now holds 'x'!

Hiding in the Shadows

```
olympus.acs.ucf.edu - PuTTY
UW PICO(tm) 4.6

username: root
password: vdf4eadf434fa
salt: 2

username: methodman
password: 434rnc442345f
salt: 4894

username: ODB
password: 34cdfer84dfs
salt: 873

username: raekwon
password: 34r8ck443fkdk
salt: 27
```

All the good stuff is locked up in the **Shadow File**...Restricted Access

Can I come in?

Username: **Neo** Password: **ThereIsNoSpoon**

1. Search for username

Saltword: **ThereIsNoSpoon362**

3. Encrypt Saltword **Crypt()**

Cryptword: **34dfkj3494fasr**

2. Append Salt

Shadow File

```
Root: as34rc4sdf3: 14
methodman: f34csr34f: 91
Neo: 34dfkj3494fasr: 362
```

4. Compare Cryptword result from entered password with what is stored in shadow file. If they match, login is successful!

They Spoof!...Made ya look!

```
olympus.acs.ucf.edu - PuTTY
login as: ma182497
ma182497@olympus.acs.ucf.edu's password:
Access denied
ma182497@olympus.acs.ucf.edu's password:
Last login: Thu Nov 18 2004 04:37:48 -0500 from 249.159.33
Sun Microsystems Inc. SunOS 5.8 Generic February 21
=====
Please do not install or copy important files to /tmp. Once
the server is rebooted, all files are removed permanently.
There are no backups of /tmp!!!
=====
olympus:/home/ma182497>
```

What had happened was...

Username: **Neo**
Password: **ThereIsNoSpoon**

Access denied

Username:

A short shell script captured the user's login password. 1. It does this by spoofing the regular login screen. The user enters their login information at the prompt. 2. Their password is rejected and the script ends, 3. calling the login program, but not before emailing the login and password information to another account. 4. The user then retries their password and everything appears to work as normal.

Ctrl + Alt + Del...What is it good for?

Login:

Ctrl + Alt + Del

Some Operating Systems can prevent this by requiring a special key combination to be entered before the login screen is presented, for example Ctrl + Alt + Del. If the login prompt appears without having pressed the “secure attention key”, you may be getting spoofed. Only the kernel should be able to detect when the “secure attention key” is pressed.

“It is Finished”

Early Design

Plain Text Password Files and Plain Text over the net

Attacks

Sniffing, Dictionary Attacks, and Spoofing

Solutions and Current State

Encryption, Salt, Shadowfile, Ctrl + Alt + Del
