## Midterm 2

Your Raw Score

Name:
Grade: $\qquad$
2 1. Let $A=(\{\mathbf{q} 1, \ldots \mathbf{q 1 0}\},\{\mathbf{0}, \mathbf{1}\}, \mathbf{q 1},\{\mathbf{q} \mathbf{3}, \mathbf{q} 7\})$ be some DFA. Assume you have computed the sets, $\mathbf{R}_{\mathbf{i}, \mathbf{j}}$, for $\mathbf{0} \leq \mathbf{k} \leq \mathbf{1 0}, \mathbf{1} \leq \mathbf{i} \leq \mathbf{n}, \mathbf{1}, \mathbf{1} \leq \mathbf{j} \leq \mathbf{n}$. In terms of the $\mathbf{R}_{\mathbf{i}, \mathbf{j}}$, what is the language recognized by A?
$L=R^{10}{ }_{1,3}+R^{10}{ }_{1,7}$
4 2. Write a Context Free Grammar for the language $\mathbf{L}$, where
$L=\left\{w \mid w \in\{a, b\}^{*}\right.$ and $w$ has twice as many a's as $b$ 's $\}$.
Hint: You need to consider all possible relative orderings of a's and b's

$$
S \rightarrow S a S a S b S|S a S b S a S| S b S a S a S \mid \lambda
$$

5 3. Use Myhill-Nerode to show that the following language $\mathbf{L}$ is not Regular.
$L=\left\{a^{k} b^{k^{2}} \mid k>0\right\}$.
Hint: Use the right-invariant equivalence relation $R_{L}$, where $\mathbf{x}_{\mathbf{L}} \mathbf{y}$ iff $\forall \mathbf{z}[\mathbf{x z} \in L \Leftrightarrow \mathbf{y z} \in L]$
Consider the equivalence classes $\left[a^{n}\right]_{\boldsymbol{R}_{\boldsymbol{L}}}, \boldsymbol{n}>\boldsymbol{0}$.
The equivalence class $[a]_{R_{L}}$ is such that $a^{i} b^{i^{2}} \in L$
However, the equivalence class $[a \dot{j}] R_{L}$ is such that $a_{j} b^{i} \in L$ iff $i=j$.
Thus, each $\left[a{ }^{i}\right] R_{L}$ is a unique class and so there are an infinite number of such classes showing that $L$ is not a Regular language.

7 4. Consider the language
$L=\left\{\mathbf{a}^{\mathbf{n}} \mathbf{b}^{\mathbf{n}} \mathbf{c}^{\mathbf{m}} \mid \mathbf{m}>\mathbf{n}\right\}$.
Let $N$ be chosen by the P.L.
Choose $w=a^{N} b^{N} c^{N+1}=u v w x y,|v w x| \leq N,|v|+|x|>0$, and $\forall i u^{i} w^{i} x^{i} y \in L$
Case 1) vwx is over a's or b's or both but no c's, choose $i=2$ :
$u v^{2 w} w x^{2} y$ has at least $N+1$ a's or $N+1$ b's or at least $N+1$ of each. In all three cases, there are not sufficient $c$ 's to be greater than both the a's and b's

Case 2) $v w x$ is over $c$ 's or $c$ 's and b's. Set $i=0$ and we will have at least one fewer $c$ 's and so there will be at least as many a's as c's.

10 5. Present the CKY recognition matrix for the string abbaab assuming the Chomsky Normal Form grammar, $\mathbf{G}=(\{\mathbf{S}, \mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \mathbf{X}\},\{\mathbf{a}, \mathbf{b}\}, \mathbf{R}, \mathbf{S})$, specified by the rules $\mathbf{R}$ :
$\mathrm{S} \rightarrow \mathrm{AB} \mid \mathrm{BA}$
$\mathrm{A} \rightarrow \mathrm{CX} \mid \mathrm{a}$
$\mathrm{B} \rightarrow \mathrm{XD} \mid \mathrm{b}$
$\mathrm{C} \rightarrow \mathrm{XA}$
$\mathrm{D} \rightarrow \mathrm{BX}$
$\mathbf{X} \rightarrow \mathbf{a} \mid \mathbf{b}$

|  | a | b | b | a | a | b |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | A, X | $B, X$ | $B, X$ | A, $X$ | $A, X$ | $B, X$ |
| 2 | $S$ | D | S,D,C | C | $S$ |  |
| 3 | B | B | A | A |  |  |
| 4 | S,D | $S, C, D$ | S, C |  |  |  |
| 5 | B | A |  |  |  |  |
| 6 | $C, S, D$ |  |  |  |  |  |

Is abbaab in $\boldsymbol{L}(\mathbf{G}) \boldsymbol{?} \quad \boldsymbol{Y E S}$
How do you know from above? S appears in last cell of CKY matrix
4 6. Give an explicit example of two Context Free Languages, L1 and L2, whose intersection is the nonContext Free Language $\left\{\mathbf{a}^{\mathbf{n}} \mathbf{b}^{\mathbf{n}} \mathbf{c}^{\mathbf{n}} \mid \mathbf{n} \geq \mathbf{0}\right\}$. No grammars or proof is required.
$\mathrm{L} 1=\underset{\sim}{\left\{a^{n} b^{n} c^{m} \mid n, m \geq 0\right\}}$
$\mathbf{L 2}=$ $\qquad$

Give an explicit example of a Regular Language, $\mathbf{R}$, whose intersection with the Context Sensitive $\mathbf{L}=\left\{\mathbf{a}^{\mathbf{n}} \mathbf{b}^{\mathbf{n}} \mathbf{c}^{\mathbf{n}} \cup \mathbf{a}^{\mathbf{n}} \mathbf{b}^{\mathbf{n}} \mid \mathbf{n} \geq \mathbf{0}\right\}$ is a Context Free, non-Regular Language. No grammars or proof is required, but you must describe the language produced by this intersection
$\mathbf{R}=\underline{a^{*} b^{*}}$
$\mathrm{L} \cap \mathrm{R}=\underline{\left\{a^{n} b^{n} \mid n \geq 0\right\}}$

8 7. Prove that any class of languages, $\boldsymbol{C}$, closed under union, concatenation, intersection with regular languages, homomorphism and substitution (e.g., the Context-Free Languages) is closed under huh where $\mathbf{L} \in \boldsymbol{C}, \mathbf{R}$ is Regular, $\mathbf{L}$ and $\mathbf{R}$ are over the alphabet $\boldsymbol{\Sigma}$, and
$\mathbf{L}$ huh $\mathbf{R}=\left\{\mathbf{y} \mid \mathbf{y} \in \Sigma^{+}\right.$and $\exists \mathbf{x}, \mathbf{z} \in \mathbf{R}^{+}$, such that $\left.\mathbf{x y z} \in \mathbf{L}\right\}$.
You may assume substitution $\mathbf{f}(\mathbf{a})=\left\{\mathbf{a}, \mathbf{a}^{\prime}\right\}$, and homomorphisms $\mathbf{g}(\mathbf{a})=\mathbf{a}$, and $\mathbf{h}(\mathbf{a})=\mathbf{a}, \mathbf{h}\left(\mathbf{a}^{\boldsymbol{\prime}}\right)=\boldsymbol{\lambda}$.
Here $\mathbf{a} \in \boldsymbol{\Sigma}$ and $\mathbf{a}$ ' is a distinct new character associated with each $\mathbf{a} \in \boldsymbol{\Sigma}$.
You must be very explicit, describing what is produced by each transformation you apply and what kind of language results.
$L$ huh $R=h\left(f(L) \cap\left(g\left(R^{+}\right) \Sigma^{+} g\left(R^{+}\right)\right)\right.$
$f(L)=\{\underline{w} \mid w \in L\}$ where $\underline{w}$ has some (or none) of its letters primed. $f(L)$ is a CFL since CFLs are closed under substitution.
$g\left(R^{+}\right)=\left\{y^{\prime} \mid y \in R^{+}\right\}$where $y^{\prime}$ has all of its letter primed. $g\left(R^{+}\right)$is Regular since Regular languages are closed under Kleene + and homomorphism.
$g\left(R^{+}\right) \Sigma^{+} g\left(R^{+}\right)=\left\{x y^{\prime} z \mid x, z R^{+}\right.$and $y \in \Sigma^{+}$, This is a Regular language since Regular languages are closed under concatenation.
$f(L) \cap\left(g\left(R^{+}\right) \Sigma^{+} g\left(R^{+}\right)=\left\{x^{\prime} y z^{\prime} \mid x y z \in L\right.\right.$ and $\left.x, z \in R^{+}\right\}$. This is a CFL since CFLs are closed under intersection with Regular.
$L$ huh $R=h\left(f(L) \cap\left(g\left(R^{+}\right) \Sigma^{+} g\left(R^{+}\right)\right)=\left\{y \mid \exists x, z \in R^{+}\right.\right.$where $\left.x y z \in L\right\}$ is a CFL since CFLs are closed under homomorphism.

8 8. Consider the $\mathrm{CFG} \mathbf{G}=(\{\mathbf{S}, \mathbf{T}, \mathbf{C}, \mathbf{D}\},\{\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d}\}, \mathbf{R}, \mathbf{S})$ where $\mathbf{R}$ is:

$$
\begin{aligned}
& \mathbf{S} \rightarrow \text { a TS } \mid \text { a T D } \\
& \mathbf{T} \rightarrow \text { b TS } \mid \text { b C } \\
& \mathbf{C} \rightarrow \mathbf{c} \\
& \mathbf{D} \rightarrow \mathbf{d}
\end{aligned}
$$

a.) Present a pushdown automaton that accepts the language generated by this grammar. You may (and are encouraged) to use a transition diagram where transitions have arcs with labels of form $\mathbf{a}, \alpha \rightarrow \beta$ where $\mathbf{a} \in \Sigma \cup\{\lambda\}, \alpha, \beta \in \Gamma^{*}$. Note: You are allowed to use extended stack operations that push more than one symbol onto stack.

Bottom Up (BU)
In state $q$ (starting state)
Shift:
$a, \lambda \rightarrow a ; b, \lambda / b ; c, \lambda \rightarrow c ; d, \lambda \rightarrow d$
In state $q$ (starting state)
Reduce:
$\lambda_{,} a T S \rightarrow S ; \lambda_{,} a T D \rightarrow S ; \lambda, b T S \rightarrow T ; \lambda, b C \rightarrow T ; \lambda_{,} c v C ; \lambda, d \rightarrow D$
Accept:
$\lambda, S \$ \rightarrow \lambda($ and enter state $f)$
OR Since in GNF can do
In state $q$ (starting state)
$a, T S \rightarrow S ; a, T D \rightarrow S ; b, T S \rightarrow T ; b, C \rightarrow T ; c, \lambda \rightarrow C ; d, \lambda \rightarrow D$
Accept:
$\lambda, S \$ \rightarrow \lambda($ and enter state $f)$
Top Down (TD)
In state $q$ (starting and only state)
$a, a \rightarrow \lambda ; b, b \rightarrow \lambda ; c, c \rightarrow \lambda ; d, d \rightarrow \lambda$
$\lambda_{\Omega} S \rightarrow a T S ; \lambda_{\Omega} S \rightarrow a T D ; \lambda_{,} T \rightarrow b T S ; \lambda_{2} T \rightarrow b C ; \lambda_{,} C \rightarrow c ; \lambda_{s} D \rightarrow d$
OR Since in GNF can do
In state $q$ (starting and only state)
$a, S \rightarrow T S ; a, S \rightarrow T D ; b, T \rightarrow T S ; b, T \rightarrow C ; c, C \rightarrow \lambda ; d, D \rightarrow \lambda$
b.) What parsing technique are you using? (Circle one) top-down or bottom-up

How does your PDA accept? (Circle one) final state or empty stack or final state and empty stack What is the initial state?
What is the initial stack content?
What are your final states (if any)?
$B U: f ; T D: \lambda$
c.) Now, using the notation of IDs (Instantaneous Descriptions, [q, $\mathbf{x}, \mathbf{z}]$ ), describe how your PDA accepts strings generated by $\mathbf{G}$.

Bottom Up [q, w, \$]|--* [f, $\lambda, \lambda] ;$ Top Down [q, w, $S] \mid-{ }_{-}^{*}[q, \lambda, \lambda]$

2 9. Consider the context-free language $\mathbf{L}=\left\{\mathbf{a}^{\mathbf{n}} \mathbf{b}^{\mathbf{m}} \mid \mathbf{n}<\mathbf{m}\right\}$. What language results when we take the Max of this language? What about the Min? To help you recall definitions, here they are.
$\operatorname{Max}(\mathbf{L})=\{\mathbf{w} \mid \mathbf{w} \in \mathbf{L}$, and if $\mathbf{w y} \in \mathbf{L}$, then $\mathbf{y}=\boldsymbol{\lambda}\}$
Max says that a string is kept only if that string is not a proper prefix of another string in $L$
Give your explicit answer for $L=\left\{a^{\mathbf{n}} b^{\mathbf{m}} \mid \mathbf{n}<\mathbf{m}\right\}$ below
$\operatorname{Max}(L)=\varnothing$
$\operatorname{Min}(\mathbf{L})=\{\mathbf{w} \mid \mathbf{w} \in \mathbf{L}$, and if $\mathbf{x y}=\mathbf{w}$ and $\mathbf{x} \in \mathbf{L}$, then $\mathbf{y}=\lambda\}$
Min says that a string is kept only if no proper prefix of that string is in $L$
Give your explicit answer for $L=\left\{a^{\mathbf{n}} b^{\mathbf{m}} \mid \mathbf{n}<\mathbf{m}\right\}$ below
$\operatorname{Min}(L)=\left\{a^{n} b^{n+1} \mid n \geq 0\right\}$
10. Consider the context-free grammar $\mathbf{G}=(\{\mathbf{S}, \mathbf{A}, \mathbf{B}\},\{\mathbf{a}, \mathbf{b}\}, \mathbf{R}, \mathbf{S})$, where $\mathbf{R}$ is:

$$
\begin{aligned}
& \mathbf{S} \rightarrow \mathbf{a A a} \mid \mathbf{b B b} \\
& \mathbf{A} \rightarrow \mathbf{C A} \mid \mathbf{A B} \\
& \mathbf{B} \rightarrow \mathbf{C} \mid \mathbf{b} \\
& \mathbf{C} \rightarrow \mathbf{D} \mid \lambda \\
& \mathbf{D} \rightarrow \mathbf{a b C}
\end{aligned}
$$

3 a.) Remove $\boldsymbol{\lambda}$-rules from $\mathbf{G}$, creating an equivalent grammar $\mathbf{G}^{\prime}$. Show all rules.
Nullable $=\{B, C\}$
$\boldsymbol{S} \rightarrow \boldsymbol{a} \boldsymbol{A} \boldsymbol{a}|\boldsymbol{b B b}| \boldsymbol{b b}$
$A \rightarrow C A|A B| A \quad / /$ can omit the $A$ or not
$\boldsymbol{B} \rightarrow \boldsymbol{C} \mid \boldsymbol{b}$
$\boldsymbol{C} \rightarrow \boldsymbol{D}$
$D \rightarrow a b C \mid a b$
2 b.) Remove all unit rules from G', creating an equivalent grammar G', Show all rules.
$\operatorname{Chain}(S)=\{S\} ; \operatorname{Chain}(A)=\{A\} ; \operatorname{Chain}(B)=\{B, C, D\} ;$
Chain $(C)=\{C, D\} ; \operatorname{Chain}(D)=\{D\}$
$S \rightarrow a A a|b B b| b b$
$A \rightarrow C A \mid A B$
$B \rightarrow \boldsymbol{b}|\boldsymbol{a b} \boldsymbol{C}| \boldsymbol{a b}$
$C \rightarrow a b C \mid a b$
$D \rightarrow a b C \mid a b$
2 c.) Remove all useless symbols, creating an equivalent grammar $\mathbf{G}^{\prime \prime}$. Show all rules.
Unproductive $=\{A\} ;$ Unreachable $=\{D\}$
$\boldsymbol{S} \rightarrow \boldsymbol{b} \boldsymbol{B} \boldsymbol{b} \mid \boldsymbol{b b}$
$B \rightarrow \boldsymbol{b}|\boldsymbol{a b}| \boldsymbol{a b C}$
$C \rightarrow a b C \mid a b$
3 d.) Convert grammar $\mathbf{G}^{\prime}{ }^{\prime}$ to its Chomsky Normal Form equivalent, $\mathbf{G}^{\mathbf{i v}}$. Show all rules.

$$
\begin{aligned}
& S \rightarrow<\boldsymbol{b}><\boldsymbol{b}>\mid<\boldsymbol{b}><\boldsymbol{b}> \\
& <\boldsymbol{b} \boldsymbol{B}>\rightarrow<\boldsymbol{b}>\boldsymbol{B} \\
& \boldsymbol{B} \rightarrow \boldsymbol{b}|<\boldsymbol{a}><\boldsymbol{b}>|<\boldsymbol{a b}>\boldsymbol{C} \\
& \boldsymbol{C} \rightarrow<\boldsymbol{a} b>\boldsymbol{C} \mid<\boldsymbol{a}><\boldsymbol{b}> \\
& <\boldsymbol{a b}>\boldsymbol{a} \boldsymbol{b} \\
& <\boldsymbol{a}>\rightarrow \boldsymbol{a} \\
& <\boldsymbol{b}>\rightarrow \boldsymbol{b}
\end{aligned}
$$
