- The Chomsky hierarchy classifies languages (sets over finite alphabets) into four types (Regular, Context-Free, Context-Sensitive and Phrase-Structured). Associated with each is a grammar type that generates languages of this type and a machine class that accepts languages of this type. The grammars have names that correspond to the language type, e.g., Context-Free Grammars. The machine hierarchy, corresponding to the language types, is Finite State, Pushdown, Linear Bounded and Turing Machine. All but Pushdown Automata have the same capability whether deterministic or non-deterministic. Only Finite State Automata have the property that they can be algorithmically reduced to a minimal form (in this case, minimal state). Undecidability problems abound for all but Regular Languages. However, all but Phrase-Structured languages have associated algorithms to determine membership.
- The notation $\mathbf{z}=\langle\mathbf{x}, \mathbf{y}\rangle$ denotes the pairing function with inverses $\mathbf{x}=\langle\mathbf{z}\rangle_{\mathbf{1}}$ and $\mathbf{y}=\langle\mathbf{z}\rangle_{\mathbf{2}}$.
- The minimization notation $\boldsymbol{\mu} \mathbf{y}[\mathbf{P}(\ldots, \mathbf{y})]$ means the least $\mathbf{y}$ (starting at $\mathbf{0}$ ) such that $\mathbf{P}(\ldots, \mathbf{y})$ is true. The bounded minimization (acceptable in primitive recursive functions) notation $\boldsymbol{\mu} \mathbf{y}(\mathbf{u} \leq \mathbf{y} \leq \mathbf{v})[\mathbf{P}(\ldots, \mathbf{y})]$ means the least $\mathbf{y}$ (starting at $\mathbf{u}$ and ending at $\mathbf{v})$ such that $\mathbf{P}(\ldots, \mathbf{y})$ is true. I define $\mu \mathbf{y}(\mathbf{u} \leq \mathbf{y} \leq \mathbf{v})[\mathbf{P}(\ldots, \mathbf{y})]$ to be $\mathbf{v}+\mathbf{1}$, when no $\mathbf{y}$ satisfies this bounded minimization.
- The tilde symbol, $\sim$, means the complement. Thus, set $\sim \mathbf{S}$ is the set complement of set $\mathbf{S}$, and the predicate $\sim \mathbf{P}(\mathbf{x})$ is the logical complement of predicate $\mathbf{P}(\mathbf{x})$.
- A function $\mathbf{P}$ is a predicate if it is a logical function that returns either $\mathbf{1}$ (true) or $\mathbf{0}$ (false). Thus, $\mathbf{P}(\mathbf{x})$ means $\mathbf{P}$ evaluates to true on $\mathbf{x}$, but we can also take advantage of the fact that true is $\mathbf{1}$ and false is $\mathbf{0}$ in formulas like $\mathbf{y} \times \mathbf{P}(\mathbf{x})$, which would evaluate to either $\mathbf{y}$ (if $\mathbf{P}(\mathbf{x})$ ) or $\mathbf{0}$ (if $\sim \mathbf{P}(\mathbf{x})$ ).
- A set $\mathbf{S}$ is recursive if $\mathbf{S}$ has a total recursive characteristic function $\chi_{\mathbf{S}}$, such that $\mathbf{x} \in \mathbf{S} \Leftrightarrow \chi_{\mathbf{S}}(\mathbf{x})$. Note $\chi_{\mathrm{s}}$ is a total predicate. Thus, it evaluates to $\mathbf{0}$ (false), if $\mathbf{x} \notin \mathbf{S}$.
- When I say a set $\mathbf{S}$ is Recursively Enumerable (RE), unless I explicitly say otherwise, you may assume any of the following equivalent characterizations:

1. $\mathbf{S}$ is either empty or the range of a total recursive function $\mathbf{f}_{\mathbf{s}}$.
2. $\mathbf{S}$ is the domain of a partial recursive function $\mathbf{g}_{\mathbf{s}}$.

- If I say a function $\mathbf{g}$ is partially computable, then there is an index $\mathbf{g}$ (we tend to overload the index as the function name), such that $\boldsymbol{\Phi}_{\mathbf{g}}(\mathbf{x})=\boldsymbol{\Phi}(\mathbf{x}, \mathbf{g})=\mathbf{g}(\mathbf{x})$. Here $\boldsymbol{\Phi}$ is a universal partially recursive function.
Moreover, there is a primitive recursive function STP, such that
$\operatorname{STP}(\mathbf{g}, \mathbf{x}, \mathbf{t})$ is $\mathbf{1}$ (true), just in case $\mathbf{g}$, started on $\mathbf{x}$, halts in $\mathbf{t}$ or fewer steps.
$\operatorname{STP}(\mathbf{g}, \mathbf{x}, \mathbf{t})$ is $\mathbf{0}$ (false), otherwise.
Finally, there is another primitive recursive function VALUE, such that
$\operatorname{VALUE}(\mathbf{g}, \mathbf{x}, \mathbf{t})$ is $\mathbf{g}(\mathbf{x})$, whenever $\operatorname{STP}(\mathbf{g}, \mathbf{x}, \mathbf{t})$.
$\operatorname{VALUE}(\mathbf{g}, \mathbf{x}, \mathbf{t})$ is defined but meaningless if $\sim \operatorname{STP}(\mathbf{g}, \mathbf{x}, \mathbf{t})$.
- The notation $\mathbf{f}(\mathbf{x}) \downarrow$ means that $\mathbf{f}$ converges when computing with input $\mathbf{x}(\mathbf{x} \in \operatorname{Dom}(\mathbf{f}))$. The notation $\mathbf{f}(\mathbf{x}) \uparrow$ means $\mathbf{f}$ diverges when computing with input $\mathbf{x}(\mathbf{x} \notin \operatorname{Dom}(\mathbf{f}))$.
- When I ask you to show one set of indices, $\mathbf{A}$, is many-one reducible to another, $\mathbf{B}$, denoted $\mathbf{A} \leq \mathbf{m} \mathbf{B}$, you must demonstrate a total computable function $\mathbf{f}$, such that $\mathbf{x} \in \mathbf{A} \Leftrightarrow \mathbf{f}(\mathbf{x}) \in \mathbf{B}$. The stronger relationship is that $\mathbf{A}$ and $\mathbf{B}$ are many-one equivalent, $\mathbf{A} \equiv \mathbf{m} \mathbf{B}$, requires that you show $\mathbf{A} \leq \mathbf{m} \mathbf{B}$ and $\mathbf{B} \leq \mathbf{m} \mathbf{A}$. The related notion of one-one reducibility and equivalence require that the reducing function, $\mathbf{f}$ above, be 1-1. The notation just replaces the $\mathbf{m}$ with a $\mathbf{1}$, as in $\mathbf{A} \leq \mathbf{1} \mathbf{B}$. We can also replace the $\mathbf{m}$ or $\mathbf{1}$ with a $\mathbf{t}$, as in $\mathbf{A} \leq \mathbf{t} \mathbf{B}$, to indicate the notion of Turing reducibility. When we say $\mathbf{A} \leq t \mathbf{B}$, we mean there is some computable algorithm that uses an Oracle for $\mathbf{B}$ to solve $\mathbf{A}$.
- The Halting Problem for any effective computational system is the problem to determine of an arbitrary effective procedure $\mathbf{f}$ and input $\mathbf{x}$, whether or not $\mathbf{f}(\mathbf{x}) \downarrow$. The set of all such pairs, $\mathbf{K}_{\mathbf{0}}$, is a classic re non-recursive set. $\mathbf{K}_{\mathbf{0}}$ is also known as $\mathbf{L}_{\mathbf{u}}$, the universal language. The related set, $\mathbf{K}$, is the set of all effective procedures $\mathbf{f}$ such that $\mathbf{f}(\mathbf{f}) \downarrow$ or more precisely $\boldsymbol{\Phi}_{\mathbf{f}}(\mathbf{f})$. $\mathbf{K}$ and $\mathbf{K}_{\mathbf{0}}$ are classic REComplete sets, meaning that every RE set many-one reduces to these hardest RE sets.
- The Uniform Halting Problem is the problem to determine of an arbitrary effective procedure $\mathbf{f}$, whether or not $\mathbf{f}$ is an algorithm (halts on all input). This set, TOTAL, is a classic non-RE, non-CoRE set. It is also called RE-Hard in our terminology.
- In the computability domain, we usually categorize problems as Recursive, Recursively Enumerable (RE), Co-Recursively Enumerable (co-RE), RE-Complete, Co-RE-Complete, and RE-Hard (my own term to describe a set for which we can show a Turing reduction from some REComplete, e.g., TOTAL is RE-Hard since $K \leq t$ TOTAL).
- When I ask for a reduction of one set of indices to another, the formal rule is that you must produce a function that takes an index of one function and produces the index of another having whatever property you require. However, I allow some laxness here. You can start with a function, given its index, and produce another function, knowing it will have a computable index. For example, given $\mathbf{f}$, a unary function, I might define $\mathbf{G}_{\mathbf{f}}$, another unary function, by
$\mathbf{G}_{\mathrm{f}}(\mathbf{0})=\mathbf{f}(\mathbf{0}) ; \mathbf{G}_{\mathrm{f}}(\mathbf{y}+\mathbf{1})=\mathbf{G}_{\mathrm{f}}(\mathbf{y})+\mathbf{f}(\mathbf{y}+\mathbf{1})$
This would get $\mathbf{G}_{\mathbf{f}}(\mathbf{x})$ as the sum of the values of $\mathbf{f}(\mathbf{0})+\mathbf{f}(\mathbf{1})+\ldots+\mathbf{f}(\mathbf{x})$.
- The Post Correspondence Problem (PCP) is known to be undecidable. This problem is characterized by instances that are described by a number $\mathbf{n}>\mathbf{0}$ and two $\mathbf{n}$-ary sequences of nonempty words $\left\langle\mathbf{x}_{1}, \mathbf{x}_{2}, \ldots, \mathbf{x}_{\mathbf{n}}\right\rangle,\left\langle\mathbf{y}_{1}, \mathbf{y}_{2}, \ldots, \mathbf{y}_{\mathbf{n}}\right\rangle$. The question is whether or not there exists a sequence, $\mathbf{i}_{1}, \mathbf{i}_{2}, \ldots, \mathbf{i}_{\mathbf{k}}$, such that $\mathbf{1} \leq \mathbf{i}_{\mathbf{j}} \leq \mathbf{n}, \mathbf{1} \leq \mathbf{j} \leq \mathbf{k}$, and $\mathbf{x}_{\mathbf{i}_{1}} \mathbf{x}_{\mathbf{i}_{2}} \cdots \mathbf{x}_{\mathbf{i}_{\mathbf{k}}}=\mathbf{y}_{\mathbf{i}_{1}} \mathbf{y}_{\mathbf{i}_{2}} \cdots \mathbf{y}_{\mathbf{i}_{\mathbf{k}}}$
- The related notion of polynomial reducibility and equivalence require that the reducing function, $\mathbf{f}$ above, be computable in polynomial time in the size of the instance of the element being checked. The notation just replaces the $\mathbf{m}$ with a $\mathbf{p}$, as in $\mathbf{A} \leq \mathbf{p} \mathbf{B}$ and $\mathbf{A} \equiv \mathbf{p} \mathbf{B}$.
- A decision problem $\mathbf{R}$ is in $\mathbf{N P}$ if it can be solved by a non-deterministic Turing machine in polynomial time. Alternatively, $\mathbf{Q}$ is in $\mathbf{N P}$ if a proposed proof of any instance having answer yes can be verified by a deterministic Turing machine in polynomial time. The set Co-NP contains the complements of all problems in NP.
- A decision problem $\mathbf{R}$ is $\mathbf{N P}$-Complete if and only if it is in $\mathbf{N P}$ and, for any problem $\mathbf{Q}$ in $\mathbf{N P}$, it is the case that $\mathbf{Q} \leq \mathbf{p} \mathbf{R}$. A decision problem $\mathbf{R}$ is $\mathbf{C o}-\mathbf{N P}-\mathbf{C o m p l e t e}$ if and only if it is in $\mathbf{C o}-\mathbf{N P}$ and, for any problem $\mathbf{Q}$ in $\mathbf{C o - N P}$, it is the case that $\mathbf{Q} \leq \mathbf{p} \mathbf{R}$.
- A function problem (typically optimization problem) $\mathbf{F}$ is $\mathbf{N P}$-Hard if and only if there is an NPComplete problem $\mathbf{Q}$ that is polynomial time Turing-reducible ( $\leq \mathbf{t p}$ ) to $\mathbf{F}$. By saying $\mathbf{Q} \leq \operatorname{tp} \mathbf{F}$, we mean that $\mathbf{Q}$ can be solved in polynomial time so long as it has an oracle for $\mathbf{F}$. We often limit our domain of consideration to decision problems when talking of NP-Hard, but the concept also applies to function problems, especially to optimizations of problems in NP-Complete.
- A function problem $\mathbf{F}$ is NP-Easy if and only if it is polynomial time Turing-reducible ( $\leq \mathbf{t p}$ ) to some $\mathbf{N P}$ problem $\mathbf{Q}$. By saying $\mathbf{F} \leq \mathbf{t p} \mathbf{Q}$, we mean that $\mathbf{F}$ can be solved in polynomial time so long as it has an oracle for $\mathbf{Q}$.
- A function problem $\mathbf{F}$ is NP-Equivalent if and only if it is both NP-Hard and NP-Easy.

4 1. Let set $\mathbf{A}$ be a non-empty Regular Language, and let $\mathbf{B}$ be a non-Regular Context-Free Language. For each of (REG) Regular, and (CFL) non-Regular Context-Free, specify if the language $\mathbf{C}$ can or cannot be of the given language type and prove your assertions. As always, assume $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ are over some finite alphabet, $\boldsymbol{\Sigma}$.
$\mathbf{C}=\mathbf{B} / \mathbf{A}=\{\mathbf{x} \mid \mathbf{w}=\mathbf{x y}$, where $\mathbf{w} \in \mathbf{B}$ and $\mathbf{y} \in \mathbf{A}\}$
Note: / is called Quotient and was extensively discussed in Class.
You may use any well-known Regular and Context-Free Languages. E.g., every language described by a Regular Expression is Regular and the set $\left\{\mathbf{a}^{\mathbf{n}} \mathbf{b}^{\mathbf{n}} \mid \mathbf{n}>\mathbf{0}\right\}$ is a CFL.
REG: (Big Hint: $\mathbf{C}$ can be Regular so show $\mathbf{A}$ and $\mathbf{B}$ where $\mathbf{B} / \mathbf{A}$ is Regular.
Explicitly describe languages $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ and you are done).

CFL: (Big Hint: $\mathbf{C}$ can be a CFL, so show $\mathbf{A}$ and $\mathbf{B}$ where $\mathbf{B} / \mathbf{A}$ is a CFL.
Explicitly describe languages $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ and you are done).
2. Let set $\mathbf{A}$ be a non-empty recursive set, and let $\mathbf{B}$ be an RE non-recursive set. For each of (REC) recursive, (RE) RE non-recursive, and (NRE) non-re, specify if the set $\mathbf{C}$ can or cannot be of the given set type and prove your assertions. Sets are subsets of the Natural Numbers.
$\mathbf{C}=\mathbf{B} / / \mathbf{A}=\{\mathbf{x} \mid x=y / / z$, where $y \in B, z \in A$ and $y / / z$ is floor $(y / z)$ if $z>0$; else $y / / 0=0\}$
Note: // is called limited division and was shown primitive recursive in Class Notes.
You may assume that $\mathbf{A}$ has the characteristic function $\chi_{\mathbf{A}}$ and also that it is the range of some total recursive function (algorithm) $\mathbf{f}_{\mathbf{A}}$, and $\mathbf{B}$ is the range of some total recursive function $\mathbf{f}_{\mathbf{B}}$.

REC: (Big Hint: $\mathbf{C}$ can be REC so show non-empty REC set $\mathbf{A}$ and RE non-recursive set $\mathbf{B}$ such that $\mathbf{B} / / \mathbf{A}$ is REC. Explicitly describe sets $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ and you are done).

RE: (Big Hint: C can be RE so show non-empty REC set A and RE non-recursive set $\mathbf{B}$ such that $\mathbf{B} / / \mathbf{A}$ is RE. Explicitly describe sets $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ and you are done).

NRE: (Big Hint: C must be RE. Prove this by showing a total recursive function whose range is $\mathbf{C}$ ).
3. Let $\mathbf{S}$ be some RE set. Prove that $\mathbf{S}$ is infinite recursive (decidable) if and only if $\mathbf{S}$ is the range of some monotonically increasing total recursive function (algorithm). Hints: To show $\mathbf{S}$ is infinite recursive, you must use its monotonically increasing enumerating function to show it is infinite and to provide its characteristic function $\chi_{\text {s }}$. To show $\mathbf{S}$ is the range of some monotonically increasing function you must explicitly present that function, $\mathbf{f}_{\mathrm{s}}$, and argue it is monotonically increasing and its range is $\mathbf{S}$. Be sure to justify that the functions you create achieve the desired goals.

7 4. Specify True (T) or False (F) for each statement.

| Statement | T or F |
| :--- | :---: |
| Membership in Phrase-Structured Languages is semi-decidable |  |
| Membership in Context-Sensitive Languages is unsolvable |  |
| Membership in Context-Free Languages can be solved in polynomial time |  |
| Membership in Regular Languages can be solved in linear time |  |
| The set of programs representing all and only algorithms is a Phrase-Structured Language |  |
| Every recursive set is recognized by some primitive recursive function |  |
| Every re set is enumerated by some primitive recursive function |  |
| PCP over a one-letter alphabet is decidable |  |
| An algorithm exists to determine if a Context-Sensitive Language is finite |  |
| Every problem solvable in linear space is of linear time complexity |  |
| A proposed solution to an instance of Vertex Cover can be checked in linear time |  |
| Petri Net Reachability is at least a doubly exponential Problem |  |
| Every NP-Hard decision problem is NP-Complete |  |
| Every NP-Complete decision problem is NP-Equivalent |  |

4 5. Let $\mathbf{P}=\left\langle<\mathbf{x}_{1}, \mathbf{x}_{2}, \ldots, \mathbf{x}_{\mathbf{n}}\right\rangle,\left\langle\mathbf{y}_{1}, \mathbf{y}_{2}, \ldots, \mathbf{y}_{\mathrm{n}} \gg, \mathbf{x}_{\mathbf{i}}, \mathbf{y}_{1} \in \Sigma^{+}, \mathbf{1} \leq \mathbf{i} \leq \mathbf{n}\right.$, be an arbitrary instance of $\mathbf{P C P}$. We can use PCP's undecidability to show the undecidability of the problem to determine if a Context Sensitive Grammar generates a non-empty language. I will start the grammar, G. You must complete it so it maps an instance of PCP to the non-emptiness problem for this $\mathcal{L}(\mathbf{G})$.
Define $\mathbf{G}=(\{\mathbf{S}, \mathbf{T}\} \cup \Sigma,\{*\}, \mathbf{S}, \mathbf{R})$, where $\mathbf{R}$ is the set of rules:
$\mathrm{S} \rightarrow \mathrm{x}_{\mathrm{i}} \mathrm{S} \mathrm{y}_{\mathrm{i}}{ }^{\mathrm{R}} \mid \mathrm{x}_{\mathrm{i}} \mathrm{T} \mathrm{y}_{\mathrm{i}}{ }^{\mathrm{R}} \quad 1 \leq \mathrm{i} \leq \mathrm{n}$ (Note: the superscripted R means Reversed) // Write the rules for the rest of this CSG.
6. Define OddsRule $(O R)=\{\mathbf{f} \mid$ for all $\mathbf{x}: \mathbf{f}(\mathbf{2 x}+\mathbf{1})>\mathbf{f}(\mathbf{2 x})\}$.

2 a.) Show some minimal quantification of some known primitive recursive predicate that provides an upper bound for the complexity of OR.

5 b.) Use Rice's Theorem to prove that OR is undecidable. Be Complete.

4 c.) Show that $\mathbf{O R}$ is many-one reducible to Total $=\{\mathbf{f} \mid \forall \mathbf{x} \mathbf{f}(\mathbf{x}) \downarrow\}$.

6
7. Consider the Venn diagram below. Identify the alphabetically labeled regions below (each representing a set of decision problems) to indicate characterizations as co-RE, co-RE-Complete, RE, RE-Complete, RE-Hard, and Recursive. To answer this, just write in the labels associated with $\mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \mathbf{E}$, and $\mathbf{F}$, choosing the most precise label for each case.
A $\qquad$ B $\qquad$ C $\qquad$ D $\qquad$ E $\qquad$ F

7 8. We described the proof that 3SAT is polynomial reducible to Subset-Sum. You must repeat that. Assuming a 3SAT expression $(\sim \mathbf{a}+\sim \mathbf{b}+\sim \mathbf{c})(\mathbf{a}+\mathbf{b}+\mathbf{c})(\mathbf{a}+\sim \mathbf{b}+\mathbf{c})$, fill in all omitted values (zeroes elements can be left as omitted) of the reduction from 3SAT to Subset-Sum.

|  | a | b | c | $\sim \mathbf{a}+\sim \mathbf{b}+\sim \mathbf{c}$ | $\mathbf{a + b + c}$ | $\mathbf{a + \sim b + c}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| a |  |  |  |  |  |  |
| $\sim \mathbf{a}$ |  |  |  |  |  |  |
| b |  |  |  |  |  |  |
| $\sim$ |  |  |  |  |  |  |
| c |  |  |  |  |  |  |
| $\sim \mathbf{c}$ |  |  |  |  |  |  |
| C1 |  |  |  |  |  |  |
| C1' |  |  |  |  |  |  |
| C2 |  |  |  |  |  |  |
| C2' |  |  |  |  |  |  |
| C3 |  |  |  |  |  |  |
| C3' |  |  |  |  |  |  |
|  | 1 | 1 | 1 | 3 | 3 | 3 |

9. Consider the decision problem to determine if there is an Independent Set of vertices of size $\mathbf{k}>\mathbf{0}$ in some undirected graph $\mathbf{G}=(\mathbf{V}, \mathbf{E})$. Here we always assume that $\mathbf{k} \leq|\mathbf{V}|$ and $|\mathbf{V}|>\mathbf{0}$, for if not the answer is a resounding NO. An independent set, $\mathbf{V}^{\prime}$, is any subset of $\mathbf{V}$, such that if $\mathbf{t}$ and $\mathbf{u}$ are in $\mathbf{V}^{\prime}$ then $(\mathbf{t}, \mathbf{u})$ is not an edge in $\mathbf{E}$. A Maximum Independent Set is an independent set of largest possible size for a given graph $\mathbf{G}=(\mathbf{V}, \mathbf{E})$. This size is called the Independence Number of $\mathbf{G}$, and denoted $\boldsymbol{\alpha}(\mathbf{G})$. The problem of finding such a set is called the Maximum Independent Set Problem.

2 a.) Show that this decision problem, computing whether or not $\mathbf{G}$ has an independent set of vertices of size $\mathbf{k}$, is Turing reducible in polynomial time, relative to the size of the representation of $\mathbf{G}$, to the Maximum Independent Set Problem. Hint: $\boldsymbol{\alpha}(\mathbf{G})$ is useful here and no proof is required.
b.) Show that the Maximum Independent Set Problem, computing $\boldsymbol{\alpha}(\mathbf{G})$, is Turing reducible in polynomial time, relative to the size of the representation of $\mathbf{G}$, to the Independent Set decision problem. Your algorithm should ask no more than $\log _{2}(|\mathbf{V}|)$ questions of an Oracle for the Independent Set decision problem, $\mathbf{I S}(\mathbf{V}, \mathbf{k})$ (does $\mathbf{V}$ have an independent set of size $\mathbf{k}$ ?) You must present detailed pseudo code. I recommend you consider using the ceiling function in your code. Hint: $\boldsymbol{\alpha}(\mathbf{G})=|\mathbf{V}|$ is the largest possible Independent Set size but can only be the correct value if $|\mathbf{E}|=\mathbf{0}$ (totally disconnected graph). The worst case, $\boldsymbol{\alpha}(\mathbf{G})=\mathbf{1}$, occurs only for a totally connected graph (every vertex connected to every other one). Thus, the range of values is $\mathbf{1} \leq \boldsymbol{\alpha}(\mathbf{G}) \leq|\mathbf{V}|$.

1 c.) Using terms like P, NP, NP-Complete, NP-Equivalent, NP-Hard, and NP-Easy, what is the most precise categorization you can provide for the Maximum Independent Set Problem?

6 10. Consider the following set of independent tasks with associated task times:
(T1,3), (T2,5), (T3,7), (T4,6), (T5,2), (T6,8), (T7,1)
Fill in the schedules for these tasks under the associated strategies below.
Greedy using the list order above:

Greedy using a reordering of the list so that longest running tasks appear earliest in the list:

11. Consider the Venn diagram below. Identify the alphabetically labeled regions below (each representing a set of decision problems) to indicate characterizations as co-NP, co-NP Complete, $\mathbf{N P}, \mathbf{N P}$-Complete, NP-Hard and $\mathbf{P}$. To answer this, just write in the labels associated with $\mathbf{A}, \mathbf{B}, \mathbf{C}$, $\mathbf{D}, \mathbf{E}$, and $\mathbf{F}$. I gave you $\mathbf{F}$ for free.
$\qquad$
$\qquad$
$\qquad$ D__ E $\qquad$ F_P(det. poly)

What is the consequence of a proof that set $\mathbf{F}=\mathbf{P}=\mathbf{D} \cap \mathbf{E}$ ? This means that the area labeled "?" is empty. In particular, would that settle the question, $\mathbf{P}=\mathbf{N P}$ ? If so, how; if not, why not?
12. An ATM (Alternating Turing Machine) can be used to solve many interesting problems.
a.) What are the two possible node types for the root of each non-empty subtree used in an ATM? What are the semantics of each type?

2 b.) What is the order of execution, relative to the size, $\mathbf{N}$, of a given CNF Boolean expression, of the fastest parallel algorithm to solve QSAT in this model of computation? Briefly justify your claim.
