

Before the contest, our team was doing great. Person B and Person C were putting in a significant amount of effort, consistently tackling practice problems and fine-tuning our strategies. Meanwhile, I initially contributed by solving practice problems alongside them, but admittedly tapered off after a few weeks due to other commitments.

During the contest, Person B's attention to detail and problem-solving skills helped us navigate tricky challenges while Person C's out of the box thinking provided solutions. I provided support where I could, leveraging my strengths in specific areas to complement their efforts.

After the contest, we discussed further problems to upsolve over the weekend. And after we finished up-solving, would we then look over the notes and practice problems before the next contest.

In terms of contribution percentages, considering our efforts before the contest, I would say that Person B and Person C each contributed around 40% due to their consistent practice and problem-solving dedication. While I initially matched their efforts, my decrease in participation would likely place my contribution closer to 20%. Despite the disparity in percentages, each of us played an important role in our team's overall success.
