The contributions on our team were pretty heavily skewed where I feel Person B and Person C each did 45% of the work overall and I only really did 10%.

I usually did very little prep before the contests, and I am honestly unsure if my other two members did any prep before the contest as there was not much communication outside of class.

During the contests we usually each attempted one problem and then if one of us got stuck we would help each other out. I was able to submit some solutions on my own to help the team but most times it was Person B or Person C, and I would on occasion help debug wrong test cases. After contests, mostly Person B and Person C also did upsolving. There were also very few times I was able to figure out a problem myself during the upsolve period.
