

Format Used for Bank Question (UCF HSPT 1994)

The header for each case is precisely as typed below:

CUSTOMER	TRANSACTION/COMPLETED	IN	OUT

There are no tabs, only spaces. The first line is 57 characters and the second line is 58 characters (not counting the newline in either case).

For each line, the name is printed, left-justified in a 16 character field, with trailing spaces to complete the 16 characters.

The second field is left-justified in a 29 character field, with trailing spaces to complete the 29 characters. The first item printed is the operation. If the operation is a loan or withdraw, then this is followed by a space, then followed by the amount. Then, all operations continue with a forward slash ("/"), followed by either "YES" or "NO".

The third field is left-justified in a 10 character field, with trailing spaces to complete the 10 characters. This field will be the time when the customer started getting processed (to the teller). It will be an integer with no leading zeroes (unless of course, the value itself is 0).

The last field is left-justified (no field width necessary since it's the last item) and is the time the customer leaves, again no leading 0s.
