SI@UCF Intro Programming
Homework Assignments: Hello World

For each assignment in the course, you will write a python program to solve the problem. Once you carefully test and comment your program, you should submit it on Webcourses. All course materials will be on the course webpage, which for 2023 is here:

http://www.cs.ucf.edu/~dmarino/ucf/bhcsi/2023/python1/

In future years, just substitute 2023 for the current year in the URL above.

In the lab you'll be shown how to open up an IDLE, type some commands in the interpreter window, and then how to create a standalone program in Python that prints "Hello World!" to the screen.

For this assignment, write a Python program that prints out two sentences:

1. Hello World!

2. A sentence that states a fun fact about yourself that will help your TA get to know you!

Make sure you have a header comment in your code. Once you've tested your program and are ready to submit it. Activate your Webcourses account and turn in your program by uploading it to the assignment "Day 1 Program"

Deliverables
1. A source file, hello.py with your solution to the problem, with a header comment.
