

**Fall 2024 COT 4210 Exam #4**  
**November 21, 2024**  
**Sheet 1: Class P**

**Last Name:** \_\_\_\_\_ , **First Name:** \_\_\_\_\_

1) (15 pts) Prove that the language,  $L$ , below, belongs to the class  $P$ . (Note: You may assume that the grader fully understands what a depth first search or breadth first search does, but you must state its run time properly.)

$L = \{ \langle G \rangle \mid G \text{ is an undirected, unweighted graph, which, with the addition of one edge, can be connected.} \}$

2) (10 pts) Prove that the language,  $L$ , below, belongs to the class  $P$ .

$L = \{ \langle S \rangle \mid S \text{ is a list where no two integers in the list are the same.} \}$

**Sheet 2: Class NP**

**Last Name:** \_\_\_\_\_ , **First Name:** \_\_\_\_\_

3) (15 pts) Let  $\text{BIGDIVISOR} = \{ (n, k) \mid n \text{ has at least one proper divisor greater than } k. \}$ .

(a) Prove that  $\text{BIGDIVISOR}$  is in NP.

(b) Explain why regular trial division (dividing  $n$  by each integer in between  $k+1$  and  $n-1$ , inclusive), doesn't prove that  $\text{BIGDIVISOR}$  is in P.

4) (20 pts) For this question, write a verifier for 3-SAT. The verifier will take in an integer array, **phi**, (several arrays of size 3), where each array represents a clause as well as a String, **s**, representing the truth setting of each variable to verify. Let the variables be  $x_1, x_2, \dots, x_k$ . A positive integer  $i$  represents the variable  $x_i$  and the negative integer  $-i$  represents the variable  $\bar{x}_i$ . Thus, the clause  $(x_2 \vee \bar{x}_5 \vee \bar{x}_6)$  would be represented by the array  $[2, -5, -6]$ . The string  $s$  will store the truth setting of each variable to verify. If the character at index  $i$  is 'T', then variable  $x_{i+1}$  is set to true and if the character at index  $i$  is 'F', then the variable  $x_{i+1}$  is set to false. Your method should return true if the truth setting in **s** satisfies the boolean formula represented in the 2D array **phi**, and false otherwise. (Note:  $n$  and  $k$  are NOT valid variable names inside of the code unless you define them...) You may assume the input is well-formed; that every variable described in  $\phi$  is represented in  $s$ . (So, you don't need to worry about array out of bounds errors if you write your code in a logically correct manner.)

```
import java.util.*;
```

```
public class e4q4 {
```

```
    public static boolean verify(int[][] phi, String s) {
```

```
    }
```

```
}
```

**Fall 2024 COT 4210 Exam #4**  
**November 21, 2024**  
**Sheet 3: Class NP-Complete**

**Last Name:** \_\_\_\_\_ , **First Name:** \_\_\_\_\_

5) (15 pts) In homework 6, we dealt with the problem 4-SAT, but never proved that it's NP-Complete. Prove that 4-SAT is NP-Complete. Do all parts of the proof.

6) (20 pts) A cut in a graph is the partition of a graph's vertices into two disjoint sets,  $S$  and  $T$ . The weight of a cut is defined as the sum of edge weights of the edges with one endpoint in  $S$  and the other endpoint in  $T$ . For the purposes of this problem, the graph is undirected. Let  $\text{MAX-CUT} = \{ \langle G, k \rangle \mid G \text{ has a cut of weight } k \text{ or more} \}$ . It can be proven that this problem is NP-Complete, thus for this problem, assume that it's known that this language is an NP-Complete language.

Consider a language called MIN-GROUP-PENALTY where the input is a set of  $n$  people who are to be placed on two disjoint teams at a cost of  $k$  or less. For each pair of distinct people,  $a$  and  $b$ , the cost of putting those two people on the same group is  $\text{cost}(a, b)$ . (Note that  $\text{cost}(a, b) = \text{cost}(b, a)$ . The theory here is that maybe  $a$  and  $b$  don't like each other, so we'll have issues if we place them on the same team and this is encapsulated in the cost function.) We can specify the language as follows:

$\text{MIN-GROUP-PENALTY} = \{ \langle C, k \rangle \mid C \text{ stores the cost matrix for all pairs of people where there exists a way to place all people onto two disjoint teams at a total cost of } k \text{ or less.} \}$

(a) Prove that MIN-GROUP-PENALTY is in NP.

(b) Via reduction from MAX-CUT, prove that MIN-GROUP-PENALTY is NP-Complete.

7) (5 pts) In what city is the Indianapolis Motor Speedway? \_\_\_\_\_
