4. Image Filtering II

## Credits

- Some slides comes directly from:
- Yogesh S Rawat (UCF)
- Noah Snavely (Cornell)
- Ioannis (Yannis) Gkioulekas (CMU)
- Mubarak Shah (UCF)
- S. Seitz
- James Tompkin
- Ulas Bagci
- L. Lazebnik

## Outline

- Image as a function
- Extracting useful information from Images
- Histogram
- Filtering (linear)
- Smoothing/Removing noise
- Convolution/Correlation
- Image Derivatives/Gradient
- Edges

## Edge Detection

- Identify sudden changes in an image
- Semantic and shape information
- Marks the border of an object
- More compact than pixels

## Images as functions...

- Edges look like steep cliffs

## Characterizing edges

- An edge is a place of rapid change in the image intensity function

intensity function
(along horizontal scanline)
first derivative

## Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?
$\checkmark \quad$ You take derivatives: derivatives are large at discontinuities.

How do you differentiate a discrete image (or any other discrete signal)?

## Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?
$\checkmark \quad$ You take derivatives: derivatives are large at discontinuities.

How do you differentiate a discrete image (or any other discrete signal)?
$\checkmark \quad$ You use finite differences.

## Finite differences

High-school reminder: definition of a derivative using forward difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}
$$

## Finite differences

High-school reminder: definition of a derivative using forward difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}
$$

Alternative: use central difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+0.5 h)-f(x-0.5 h)}{h}
$$

For discrete signals: Remove limit and set $\mathrm{h}=2$

$$
f^{\prime}(x)=\frac{f(x+1)-f(x-1)}{2} \quad \begin{aligned}
& \text { What convolution kernel } \\
& \text { does this correspond to? }
\end{aligned}
$$

## Finite differences

High-school reminder: definition of a derivative using forward difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}
$$

Alternative: use central difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+0.5 h)-f(x-0.5 h)}{h}
$$

For discrete signals: Remove limit and set $\mathrm{h}=2$

$$
f^{\prime}(x)=\frac{f(x+1)-f(x-1)}{2}
$$

## Example 1D signal

How do we compute the derivative of a discrete signal?

$$
f^{\prime}(x)=\frac{f(x+1)-f(x-1)}{2}=\frac{210-10}{2}=100
$$

ID derivative filter

## The Sobel filter

- How are the other filters derived and how do they relate to the Sobel filter?
- How would you derive a derivative filter that is larger than $3 \times 3$ ?

## Computing image gradients

1. Select your favorite derivative filters.

$$
\boldsymbol{S}_{x}=\begin{array}{|l|l|l|}
\hline 1 & 0 & -1 \\
\hline 2 & 0 & -2 \\
\hline 1 & 0 & -1 \\
\hline
\end{array}
$$

$$
\boldsymbol{S}_{y}=\begin{array}{|c|c|c|}
\hline 1 & 2 & 1 \\
\hline 0 & 0 & 0 \\
\hline-1 & -2 & -1 \\
\hline
\end{array}
$$

## Computing image gradients

1. Select your favorite derivative filters.

$$
\boldsymbol{S}_{x}=\begin{array}{|l|l|l|}
\hline 1 & 0 & -1 \\
\hline 2 & 0 & -2 \\
\hline 1 & 0 & -1 \\
\hline
\end{array}
$$

$$
\boldsymbol{S}_{y}=\begin{array}{|c|c|c|}
\hline 1 & 2 & 1 \\
\hline 0 & 0 & 0 \\
\hline-1 & -2 & -1 \\
\hline
\end{array}
$$

2. Convolve with the image to compute derivatives.

$$
\frac{\partial \boldsymbol{f}}{\partial x}=\boldsymbol{S}_{x} \otimes \boldsymbol{f} \quad \frac{\partial \boldsymbol{f}}{\partial y}=\boldsymbol{S}_{y} \otimes \boldsymbol{f}
$$

## Computing image gradients

1. Select your favorite derivative filters.

$\boldsymbol{S}_{y}=$| 1 | 2 | 1 |
| :---: | :---: | :---: |
| 0 | 0 | 0 |
| -1 | -2 | -1 |

2. Convolve with the image to compute derivatives.

$$
\frac{\partial \boldsymbol{f}}{\partial x}=\boldsymbol{S}_{x} \otimes \boldsymbol{f} \quad \frac{\partial \boldsymbol{f}}{\partial y}=\boldsymbol{S}_{y} \otimes \boldsymbol{f}
$$

3. Form the image gradient, and compute its direction and amplitude.

$$
\nabla \boldsymbol{f}=\left[\frac{\partial \boldsymbol{f}}{\partial x}, \frac{\partial \boldsymbol{f}}{\partial y}\right] \quad \theta=\tan ^{-1}\left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x}\right) \quad\|\nabla f\|=\sqrt{\left(\frac{\partial f}{\partial x}\right)^{2}+\left(\frac{\partial f}{\partial y}\right)^{2}}
$$

## Image Gradient

Gradient in x only

Gradient in y only

Gradient in both x and y

Gradient direction

$$
\theta=\tan ^{-1}\left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x}\right)
$$

How does the gradient direction relate to the edge?

## Gradient magnitude

$$
\|\nabla f\|=\sqrt{\left(\frac{\partial f}{\partial x}\right)^{2}+\left(\frac{\partial f}{\partial y}\right)^{2}}
$$

## Image gradient example

original
gradient amplitude

vertical derivative

How does the gradient direction relate to these edges?

## How do you find the edge of this signal?

## How do you find the edge of this signal?

Using a derivative filter:

What's the problem here?

## Differentiation is very sensitive to noise

When using derivative filters, it is critical to blur first!

How much should we blur?

## Derivative of Gaussian (DoG) filter

Derivative theorem of convolution: $\quad \frac{\partial}{\partial x}(h \star f)=\left(\frac{\partial}{\partial x} h\right) \star f$

## Laplace filter

Basically a second derivative filter.

- We can use finite differences to derive it, as with first derivative filter.
first-order finite difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+0.5 h)-f(x-0.5 h)}{h} \longrightarrow
$$

1D derivative filter

| 1 | 0 | -1 |
| :--- | :--- | :--- |

second-order finite difference

$$
f^{\prime \prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-2 f(x)+f(x-h)}{h^{2}} \longrightarrow
$$

## Laplace filter

Basically a second derivative filter.

- We can use finite differences to derive it, as with first derivative filter.
first-order finite difference

$$
f^{\prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+0.5 h)-f(x-0.5 h)}{h} \longrightarrow
$$

1D derivative filter

| 1 | 0 | -1 |
| :--- | :--- | :--- |

$$
\begin{gathered}
\text { second-order } \\
\text { finite difference }
\end{gathered} f^{\prime \prime}(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-2 f(x)+f(x-h)}{h^{2}} \longrightarrow \begin{array}{|l|l|l|}
\hline 1 & -2 & 1 \\
\hline
\end{array}
$$

## Laplacian of a Gaussian

The Laplace of Gaussian (LoG) of image $f$ can be written as

$$
\nabla^{2}(f * g)=f * \nabla^{2} g
$$

with $\boldsymbol{g}$ the Gaussian kernel and * the convolution. That is, the Laplace of the image smoothed by a Gaussian kernel is identical to the image convolved with the Laplace of the Gaussian kernel. This convolution can be further expanded, in the 2D case, as

$$
f * \nabla^{2} g=f *\left(\frac{\partial^{2}}{\partial x^{2}} g+\frac{\partial^{2}}{\partial y^{2}} g\right)=f * \frac{\partial^{2}}{\partial x^{2}} g+f * \frac{\partial^{2}}{\partial y^{2}} g
$$

Thus, it is possible to compute it as the addition of two convolutions of the input image with second derivatives of the Gaussian kernel (in 3D this is 3 convolutions, etc.). This is interesting because the Gaussian kernel is separable, as are its derivatives. That is,

$$
f(x, y) * g(x, y)=f(x, y) *(g(x) * g(y))=(f(x, y) * g(x)) * g(y)
$$

meaning that instead of a 2 D convolution, we can compute the same thing using two 1D convolutions. This saves a lot of computations. For the smallest thinkable Gaussian kernel you'd have 5 samples along each dimension. A 2 D convolution requires 25 multiplications and additions, two 1D convolutions require 10. The larger the kernel, or the more dimensions in the image, the more significant these computational savings are.

Thus, the LoG can be computed using four 1D convolutions. The LoG kernel itself, though, is not separable.

There is an approximation where the image is first convolved with a Gaussian kernel and then $\nabla^{2}$ is implemented using finite differences, leading to the $3 \times 3$ kernel with -4 in the middle and 1 in its four edge neighbors.

The Ricker wavelet or Mexican hat operator are identical to the LoG, up to scaling and normalization.

## Laplacian of Gaussian (LoG) filter

As with derivative, we can combine Laplace filtering with Gaussian filtering

## Laplacian of Gaussian (LoG) filter

As with derivative, we can combine Laplace filtering with Gaussian filtering

## Laplace and LoG filtering examples

Laplacian of Gaussian filtering

Laplace filtering

## Laplacian of Gaussian vs Derivative of Gaussia

Laplacian of Gaussian filtering
Derivative of Gaussian filtering

## Laplacian of Gaussian vs Derivative of Gaussia

Laplacian of Gaussian filtering

Derivative of Gaussian filtering

Zero crossings are more accurate at localizing edges (but not very convenient).

## 2D Gaussian filters

$$
h_{\sigma}(u, v)=\frac{1}{2 \pi \sigma^{2}} e^{-\frac{u^{2}+v^{2}}{2 \sigma^{2}}}
$$

## Gaussian

$$
\frac{\partial}{\partial x} h_{\sigma}(u, v)
$$

Derivative of Gaussian

$$
\nabla^{2} h_{\sigma}(u, v)
$$

Laplacian of Gaussian
