Alg #3: Base b_1 to Base b_2

$b_1 \rightarrow 10 \rightarrow b_2$ (use algs above)

Alg 4: b_1 to b_2 when both are powers of 2
 $b_1 \in \{2, 4, 8, 16\}$
 $b_2 \in \{2, 4, 8, 16\}$

$b_1 \rightarrow 2 \rightarrow b_2$

Bitwise Operators

in the computer, integers are stored in binary (2's complement)

We can think of an integer as a ~~binary~~ boolean array of size 32

$$164 = 2^7 + 2^5 + 2^2$$

128
16

If you need a boolean array of size 32 or less, you can use a single integer instead.

Learn how to

(a) read a particular bit

(b) write a particular bit

Several bitwise operators that will help us with (a) + (b), AND make certain calculations very easy (with a array loop would be required but with operators only + single stmt is needed)

If these were 2 arrays, I'd have to do a loop
lists which items are common to both groups
