Dynamic Content in PHP

- Of all the strengths PHP exhibits as a server-side scripting language, perhaps its greatest strength lies in its ability to dynamically change XHTML output based on user input.
- In this final section of notes, we'll build on the examples we've constructed in the previous two sets of notes by combining `form.html` and `form.php` into one dynamic PHP document named `dynamicForm2.php`.
- We'll add error checking to the user input fields and inform the user of invalid entries on the form itself, rather than on an error page. If an error exists, the script maintains the previously submitted values in each form element.
- Finally, after the form has been successfully completed, we'll store the input from the user in a MySQL database.

Hi **Mark**. Thank you for completing the survey.
You have been added to the **Pro Cycling** mailing list.

The following information has been saved in our database:

Name	Email	Phone	OS
Mark Llewellyn	markl@cs.ucf.edu	(407)823-2790	Windows XP

[Click here to view entire database.](#)

Done Local intranet

A blue callout box with a pointer pointing towards the "Click here to view entire database." link contains the text: "Screen the user sees after clicking the Register button."

A callout box with a black border and white text is positioned on the right side of the page, pointing towards the "First Name" field. The text inside the box reads:

Dynamic nature of the PHP form is illustrated when the user fails to enter proper information into the form. In this case, the user forgot to enter their first name. Error checking is in place on each user input location and the page is dynamically updated to reflect the error processing and correction capabilities. The database will not be updated until the user has correctly filled in all required fields.

The screenshot shows the MySQL Query Browser interface. The title bar reads "MySQL Query Browser - root@localhost:3306 / MailingList". The menu bar includes File, Edit, View, Query, Script, Tools, and Help. The toolbar contains icons for Go back, Next, Refresh, Execute, Stop, and various query and table manipulation tools. A query window displays the SQL command: "SELECT * FROM `contacts` c". The main area shows a table titled "Resultset 1" with the following data:

ID	LastName	FirstName	Email	Phone	Magazine	OS
12	Schumacher	Ralf	ralf@toyota.com	(222)222-222	Cycling Weekly	Other
11	Thurau	Didi	agirl.de	(456)123-334	Mirror du Cyclisme	Windows 98
10	Jolie	Angelina	hollywood.com	(123)456-789	Velo-News	Windows XP
9	Schumacher	Michael	michael@ferrari.it	(407)823-279	RadSport	Windows 2000
13	Campbell	Kristy	im_not_sure	(345)987-654	Cycle Sport	Windows 2000
14	Einstein	Albert	relative	(111)222-333	Cycling Weekly	Other
16	Llewellyn	Mark	markl@cs.ucf.edu	(407)823-279	Pro Cycling	Windows XP

The bottom status bar indicates "7 rows fetched in 0.0057s (0.0006s)". A callout box points from the bottom left of the table area to a text box containing the following text:

Screen shot from MySQL of the contacts relation after the inclusion of several users. Note that the values in the table are the same as those returned to the PHP document in the previous slide.

}
print( "<!-- post form data to dynamicForm2.php -->
<form method = 'post' action = 'dynamicForm2.php'>
<img src = 'images/user.gif' alt = 'User' /><br />
<span style = 'color: blue'>
Please fill out the fields below.<br />
</span>
```

Invoke PHP script to see contents of entire database if user clicks this link. Code begins on page 14.

The form created is self-submitting (i.e., it posts to itself). This is done by setting the action to dynamicForm2 . php

```
<!-- create four text boxes for user input -->" );
foreach ( $inputlist as $inputname => $inputalt ) {
    $inputtext = $inputvalues[ $inputname ];

    print( "<img src = 'images/$inputname.gif"
        alt = '$inputalt' /><input type = 'text' name = '$inputname' value = "" . $$inputname . " />" );
    if ( $formerrors[ ( $inputname )."error" ] == true )
        print( "<span style = 'color : red'>*</span>" );
    print( "<br />" );
}
print( "<span style = 'font-size : 10pt'" );
if ( $formerrors[ "phoneerror" ] ) print( "; color : red" );
print( ">Must be in the form (555)555-5555
</span><br /><br />
<img src = 'images/downloads.gif'
alt = 'Publications' /><br />
<span style = 'color: blue'>
Which magazine would you like information about?
</span><br />
<!-- create drop-down list containing magazine names -->
<select name = 'mag'>" );
foreach ( $maglist as $currmag ) {
    print( "<option" );
    if ( ( $currmag == $mag ) )
        print( " selected = 'true'" );
    print( ">$currmag</option>" );
}
```

The \$\$variable notation specifies variable variables. PHP permits the use of variable variables to allow developers to reference variables dynamically. The expression \$\$variable could also be written as \${\$variable} for added clarity.

```
print( "</select><br /><br />
<img src = 'images/os.gif' alt = 'Operating System' />
<br /><span style = 'color: blue'>
Which operating system are you currently using?
<br /></span>

<!-- create five radio buttons -->" );

$counter = 0;

foreach ( $systemlist as $currsystem ) {
    print( "<input type = 'radio' name = 'os'
        value = '$currsystem'" );

    if ( $currsystem == $os ) print( "checked = 'checked'" );
    if ( iserror && $counter == 0 ) print( "checked = 'checked'" );

    print( " />$currsystem" );

    if ( $counter == 2 ) print( "<br />" );
    $counter++;
}

print( "<!-- create a submit button -->
<br />
<input type = 'submit' name = 'submit' value = 'Register' />
</form></body></html>" );
?>
