</table>
Research in Computer Science spans a wide range of topics. At UCF research in Computer Science emphasizes:

- Innovative uses for computation (including new applications, algorithms, protocols, and tools),
- Studies of issues surrounding computation (including security, theory, human-computer interaction, and insights into the design, programming and verification of programs and systems), and
- Investigations into the nature of computation (including questions such as: what is intelligence?).

Typically, writing a computer program is not considered worthy of a research publication, unless the program is being used to demonstrate some new tool, programming technique, or has some other purpose driven by the kinds of Computer Science questions described above. Thus, while we are eager to partner with others in research, our potential research partners need to be aware that computer science research is not the same as programming.

Our faculty have won many awards (such as best paper awards at conferences) and have been recognized by various professional societies. We have on our faculty a member of the National Academy of Engineering, 5 Fellows of the IEEE, one ACM Fellow (and one retired), 1 IAPR Fellow, 1 SPIE Fellow, and 1 Fellow of the AAAS (and one retired). Our faculty also includes 8 NSF CAREER award winners, 3 AFOSR Young Investigator award winners, and 2 DARPA CS Study Group award winners. See http://www.cs.ucf.edu/about/facawards.php for more details and other faculty awards.

In what follows we give a brief overview of the main research areas in Computer Science at UCF.

**Computer Vision** addresses the problem of how to use computers to process visual information, including pictures and videos. Specific problems include detection and recognition of objects, features, or actions, segmentation of videos, and using image or video data in computational processes. Drs. Bagei, Foroosh, da Vitoria Lobo, Mahalanobis, Rawat, Shah, and Welch work in this area.

**Image and Video Processing** addresses the problems of acquisition, storage, retrieval, and processing of images, videos, and high dimensional signals for extraction and analysis of useful information for human users, robots, and autonomous systems. Specific problems include design and analysis of imaging sensors, high-dimensional signal representation and transformation, compression methods, image/video retrieval, 3D sensing and modeling, medical imaging, space imaging, and live video computing. Drs. Bagei, Foroosh, Gong, and Hua work in this area.

**Virtual Reality (VR)** is a multidisciplinary area of research aimed at interactive computer-mediated immersive simulations of environments or experiences typically involving sight, sound, and touch. Simulations involving a blending of real and virtual objects is often referred to as Augmented Reality (AR). Research in VR/AR encompasses a wide range of fundamental topics, including computer graphics, multi-modal systems (e.g., displays, tracking, haptics, robotics), 3D interaction, illusions of presence/tele-presence, and human factors. One of our current foci is on human-centered experiences involving avatars and virtual humans for training teachers, healthcare practitioners, and military personnel.

**Human Computer Interaction (HCI)** is the scientific study how humanity communicates with all aspects of computing technology. HCI is an interdisciplinary field that spans computer science, computer engineering, psychology, human factors, and cognitive science. In our department, we focus specifically on developing and evaluating interactive systems that help to improve people's lives when using computer-based environments. We focus on improving the user experience in application areas such as education, entertainment, medicine, robotics, and general work productivity. Drs. Cruz-Neira, Hughes, LaViola, McMahan, Mell, Welch, and Wisniewski work in these areas.

**Artificial Intelligence (AI)** seeks to understand the fundamental nature of intelligence and how to make computers exhibit intelligent behavior. **Machine Learning** addresses the problem of how to automatically learn concepts and behaviors from data. With seven faculty in AI and machine learning, UCF CS is highly active in these areas. Major research strengths include complex systems, data mining, diagnostics, evolutionary computation, intelligent simulation, knowledge representation, learning from observation of human performance, multi-agent systems, natural language processing, neural
networks, neuroevolution, robotics, and social informatics. Drs. Boloni, Fu, Gong, Gonzalez, Hu, Liu, Sukthankar, and Wu work in this area.

**Computer Graphics** addresses the problem of how to produce images of objects from their mathematical descriptions using computers. Examples of specific research foci include how to render realistic looking objects, how to animate such objects, and how to use rendering and animation for simulation and interactive training including Virtual Reality and Augmented Reality. Some of our work involves computer vision/image processing, for example interactive view synthesis and Spatial Augmented Reality. Drs. McMahan, Pattanaik, and Welch work in this area.

**Software Engineering** addresses the problem of how to produce quality software on time and within a specific budget. **Systems** work addresses the problem of how to build large computer systems that accomplish some specific purpose. Specific research problems in Software Engineering that we are investigating include: how best to describe what software systems are supposed to do (specification), how to ensure that computational systems behave correctly (verification), model checking of software and hardware systems with a particular emphasis on scalable formal verification of cyber-physical systems and quantitative computational models, how to parallelize systems for maximum efficiency, how to model, analyze, and optimize the performance of software, and how to build large, concurrent and distributed systems. Drs. Dechev, Gazzillo, Hua, Jha, Leavens, Marinescu, Turgut, and Wang work in these areas.

**Database** research addresses the problem of storage and retrieval of data. Information must be stored in a fashion that allows both efficient and convenient retrieval by people and applications. Specific problems addressed in research at UCF include techniques for parallel and distributed processing of very large data sets, database management as a service, moving object databases for mobile computing, querying multimedia databases that may include online cameras as a special class of storage devices, database management in the Internet of Things, and data privacy and security. Drs, Hua, Llewellyn, and Zou work in this area.

**Parallel Computation** deals with the theory and practice of organizing computations to run faster on machines with several processors. Different models of parallelism are studied along with parallelizability of various problems. Practical aspects involve designing parallel algorithms and data structures to solve compute-intensive problems on rapidly evolving platforms with massive parallelism, fast and efficiently. A key challenge for creating and adapting parallel software applications is the high architectural complexity of HPC systems in terms of their degree of concurrency and heterogeneity, sensitivity to communications and data movement, and requirements for locality. Enabling effective large-scale multiprocessor computing will have an impact that crosscuts multiple areas of science. There are still many barriers involved in building efficient HPC software applications and hardware platforms. Research at UCF aims to provide the fundamental tools and techniques for understanding how to design applications and algorithms for the rapidly evolving massively parallel chip architectures. Drs. Dechev, Heinrich, Hua, Jha, Marinescu, Solihan and Wang work in this area.

**Networking and Mobile Computing** is concerned with designing efficient communications protocols and architectures for exchanging data among computers and mobile devices. The scientific results of the field enable a wide range of networked applications and enhance the real-world experience of network and mobile users. Research areas investigated by our faculty include but are not limited to resource management techniques in ad hoc, cellular, and cognitive radio networks, challenging topics in sensor networks such as intruder tracking, underwater sensors and maximizing value of information, intelligent sharing of wired and wireless bandwidth, and real-time transmission of audio and video over wireless networks/Internet. Drs. Chatterjee, Hua, Mohaisen, and Turgut work in this area.

**Computer Security** is concerned with designing mechanisms for protecting computers and networks from attacks, keeping information confidential and safe from tampering, preventing unauthorized access to resources, and providing robust security to various applications including e-commerce transactions. Research areas investigated by our faculty include but are not limited to Intrusion Prevention and Detection, Malware Propagation Modeling and Analysis, Security of Wireless Networks, Sensor Networks and Vehicular Ad hoc Networks, Authentication Protocols, and Cloud Security. **Digital Forensics** addresses the problem of recovering evidence (e.g., to be used in court) from computers, mobile devices, or any
storage media that may hold data in binary form. Drs. Chen, Jha, Gazzillo, Leavens, Mohaisen, Solihin, Wocjan, and Zou work in these areas.

**Bioinformatics** is an interdisciplinary field to study various biological problems using advanced computational and statistical methods. With large-scale high-throughput biological data rapidly accumulated, this fast-growing field has become an indispensable part to biology research, also an important avenue for computer scientists to study biological problems. Bioinformatics research at UCF CS focuses on the following several areas: computational genomics, metagenomics, non-coding RNA and RNA genomics, systems biology to model gene protein interactions and gene regulation, and machine learning and data mining algorithms to integrate massive biological data and networks. Computational systems biology is the new and upcoming inter-disciplinary science that combines approaches from dynamical systems, control theory, formal methods, and process algebra to study the complex interactions within and among biological systems. Building on the existing success of bioinformatics and bio-imaging research, computational **systems biology** constructs mathematical and computational models so as to facilitate a holistic understanding of biological systems; hence, it differs fundamentally from the reductionist view of traditional studies in life sciences. Together with partners from medical schools and national laboratories, we are studying translational computational systems biology with applications in drug design, metabolic networks, clinical decision making, and the design of verified biomedical cyber-physical systems. Drs. Hu, Jha, Thankachan, Yooseph, Shaojie Zhang, and Wei Zhang work in these areas.

**Theory of Computing** addresses the problem of understanding the fundamental nature and limits of computation. Algorithms addresses the problem of how to best solve specific problems using minimal time and space resources. Quantum Computing addresses the problem of how to compute using quantum mechanical phenomenon, such as photons. Specific problems in the Theory of Computing include how to classify problems as to their degree of difficulty. Specific problems in Algorithms include finding (optimal) algorithms for computing problems and proving that a given problem requires a certain minimum amount of resources for its solution. Specific problems in Quantum Computing include finding algorithms for solving problems efficiently using quantum information. Drs. Deo, Hughes, Marinescu, Thankachan, Wocjan, Yooseph, and Shaojie Zhang work in these areas.

**Computer architecture** research focuses on designing computer systems optimized for high performance, energy efficiency, and scalability or some combination thereof. This research may focus on many aspects of computer systems including the design of processors, memory systems, GPUs, mobile and embedded devices, big data I/O systems, networks, and large-scale parallel machines. Specific problems include the hardware/software co-design of energy efficient architectures for heterogeneous multicore processors and understanding the interaction of file systems and parallel I/O systems in big data applications and its implications for modern file system design. Drs. Chen, Heinrich, and Solihin work in this area.
Ulas Bagci

Assistant Professor
Ph.D., Computer Science: University of Nottingham, UK, 2010.
Principal Investigator (NIH R01)

• UCF Chapter of National Academy of Inventors
• IEEE Technical Expert for Virtual, Augmented and Mixed Reality 2018
• IEEE Outstanding Performance, Co-Chair, VR 2013
• 1995 “An Introduction to the Kalman Filter” cited over 8,000 times according to Google Scholar
• Senior Member, IEEE Computer Society and Member, ACM
• Pioneer, ACM SIGGRAPH
• Excellence in Teaching award, UNC-Chapel Hill, 2007

Elaine Weyuker

University Distinguished Professor
Ph.D., Computer Science; Rutgers University, 1977

Contact
Elaine.Weyuker@ucf.edu

Research
Dr. Weyuker’s research interests focus on broad areas of software engineering, and particularly software fault prediction, software testing and software metrics and measurement. She is known for doing large industrial empirical studies to validate many of her proposed research solutions. In an earlier life, Dr. Weyuker did research in Theory of Computation and is the co-author of a book "Computability, Complexity, and Languages" with Martin Davis and Ron Sigal.

Other Experience
Prior to joining UCF in 2017 Dr. Weyuker was an AT&T Fellow and Distinguished Member of the Technical Staff doing software engineering research at AT&T Labs. Earlier, she was a professor of Computer Science at NYU's Courant Institute of Mathematical Sciences.

Professional Activities
Dr. Weyuker has served as a member of the Rutgers University Graduate Dean's Advisory Board since 2004, served as the chair of ACM's Council on Women in Computing (ACM-W) from 2004-2012, as a member of the Executive Committee of the Coalition to Diversify Computing from 2003-2016, as well as a member of the Board of Directors of the Computing Research Association from 2000-2005.

Honors & Awards
Dr. Weyuker has served as a member of the Rutgers University Graduate Dean's Advisory Board since 2004, served as the chair of ACM's Council on Women in Computing (ACM-W) from 2004-2012, as a member of the Executive Committee of the Coalition to Diversify Computing from 2003-2016, as well as a member of the Board of Directors of the Computing Research Association from 2000-2005.

In 2009 one of her publications won the ACM SIGSOFT Retrospective Impact Paper Award for a highly influential paper that has continued to have impact on the field for more than 25 years. Among her other awards are the AT&T Chairman's Diversity Award.

- UCF Research Incentive Award, 2019
- UCF Teaching Incentive Program Award, 2017
- Faculty Member, Upsilon Pi Epsilon (UPE) Honor Society for Computing and Information Disciplines, 2016
- Best Paper Award, ASP-DAC 2016
- Best Paper Award, IEEE ICCABS 2012
- J. Craig Venter Institute Summer Fellowship, 2006
- California Institute for Telecommunications and Information Technology (CalIT2) Fellowship, 2001

Wei Zhang

Assistant Professor
Ph.D., Computer Science;
University of Minnesota-Twin Cities, 2015

Contact
wzhang.cs@ucf.edu

Research
http://server.cs.ucf.edu/compbio/
- Computational Biology and Bioinformatics
  - Cancer Transcriptome
  - Biomarker Identification
  - Post-transcriptional Regulation
  - Drug Sensitivity Prediction
- Machine Learning
  - Network-based Learning
  - Semi-supervised Learning
  - Reinforcement Learning
  - Transfer Learning

Other Experience
- Research Associate, University of Minnesota-Twin Cities (2015-2017)
- Research Intern, Takeda Pharmaceuticals Company (2014)

Professional Activities
- ACM-BCB 2019 Workshop Chair
- ICIBM 2020 Publication Chair
- NSF panel member (2018-2020)
- Reviewers for Nucleic Acids Research, Bioinformatics, PLoS One, BMC Bioinformatics, BMC Genomics, and others

Honors & Awards
- NSF CRII (2018)
- Best Poster Award, The 6th Annual Biomedical Informatics and Computational Biology Research Symposium (2014)

Selected Publications
- Wei Zhang, Jeremy Chien, Jeongsik Yong, and Rui Kuang. Network-based Machine Learning and Graph Algorithms for Precision Oncology. npj Precision Oncology, 2017.
Cliff C. Zou

Associate Professor
Program Coordinator, Digital Forensics Master Program
Ph.D., Electrical & Computer Engineering;
University of Massachusetts-Amherst, 2005

Professional Activities
- Program Committee Member for dozens of conferences
- NSF panelist (2011,2016); NIH panelist (2014)
- Senior Member: IEEE

Honors & Awards
- Publications have more than 6100 citations according to Google Scholar Citation.
- Best Student Paper Award in conference ACSAC 2007.
- Received UCF Teaching Incentive Program (TIP) award, 2013.
- Undergraduate research project "Personal Medication Monitor" won the first price in the first annual UCF Inventing Entrepreneurs Innovation Competition (reported by UCF News).
- Paper "Honeypot detection in advanced botnet attacks" published in IJICS (2010) was reported by EurekAlert! News Service and The Register, respectively.
- Rootkit work (paper published in Securecomm'08) was reported by PCWorld (05/09/2008).
- Research published in NDSS'06 reported by “New Scientist Magazine”, Mar. 4, 2006 189(2541), pg. 32.
- Best Paper Award runner-up in PADS 2005.
- Best Paper Award runner-up in ICCCN 2004.
- Interviewed by National Public Radio (NPR) on our Internet worm research, September 2003
