

Project 1: Business idea with an object detector

In one paragraph, propose a business idea that relies on you being able to run an object detector. Propose an idea different from the one proposed in the class (intelligent sunglasses for blind people). Try to propose an example where the object detector is a key part of the product, and the rest is relatively simple. For instance, don't propose something like a self-driving car, which needs many other things beyond the object detector.
